A NOTE ON THE EXPONENTIAL CONVERGENCE RATE FOR PRODUCTS OF SUMS

Yu Miao and Bin Qian

Abstract. In this paper, we establish an exponential convergence theorem for products of sums of independent identically distributed positive random variables.

1. Introduction

Let \((X_n)_{n \geq 1}\) be a sequence of independent identically distributed (i.i.d.) positive random variables and define the partial sums \(S_n = \sum_{i=1}^{n} X_i\) and the product of sums \(T_n = \prod_{k=1}^{n} S_k\) for \(n \geq 1\). In the past decade, there have been many studies about the asymptotic properties for the products of partial sums \(T_n\).

The study for the product of partial sums was initiated by Arnold and Villaseñor [1] who considered the limiting properties of the sums of records. In their paper, the authors obtained the following version of the central limit theorem (CLT) for a sequence of i.i.d. exponential r.v.'s \((X_n)_{n \geq 1}\) with the mean equal to one:

\[
\frac{\sum_{k=1}^{n} \log S_k - n \log n + n}{\sqrt{2n}} \overset{\mathcal{L}}{\rightarrow} N, \quad \text{as } n \to \infty,
\]

where \(N\) is a standard normal r.v. Here we think that it is interesting to recall that the products of i.i.d. positive, square integrable random variables are asymptotically log-normal. This fact is an immediate consequence of the classical CLT. In [11], Rempala and Wesolowski have noted that this limit behavior of the product of partial sums has a universal character and holds for any sequence of square integrable, positive i.i.d. random variables. Namely, they have proved the following result.

**Theorem RW.** Let \((X_n)_{n \geq 1}\) be a sequence of i.i.d. positive square integrable random variables with \(\mathbb{E}X_1 = \mu, \text{Var}X_1 = \sigma^2 > 0\) and the coefficient of variation

---

2010 AMS Subject Classification: 60F10, 60G05.

Keywords and phrases: The exponential convergence; moderate deviation principle; products of sums; positive random variables.
\[ \gamma = \sigma / \mu. \] 

Then
\[
\left( \frac{\prod_{k=1}^{n} S_k}{n! \mu^n} \right)^{1/(\gamma \sqrt{n})} \xrightarrow{\mathcal{L}} e^{\sqrt{2N}}.
\]

Recently, Gonchigdanzan and Rempala [3] obtained the first almost sure central limit theorem (ASCLT) for the product of the partial sums of i.i.d. positive random variables as follows.

**Theorem GR.** Let \((X_n)_{n \geq 1}\) be a sequence of i.i.d. positive square integrable random variables with \(\mathbb{E}X_1 = \mu > 0\), \(\text{Var}X_1 = \sigma^2\). Denote by \(\gamma = \sigma / \mu\) the coefficient of variation. Then for any real \(x\),
\[
\lim_{N \to \infty} \frac{1}{\log N} \sum_{n=1}^{N} \frac{1}{n} I \left( \left( \frac{\prod_{k=1}^{n} S_k}{n! \mu^n} \right)^{1/(\gamma \sqrt{n})} \leq x \right) = F(x), \ a.s.
\]
where \(F(\cdot)\) is the distribution function of the r.v. \(e^{\sqrt{2N}}\).

For the further discussions of the CLT, the author refers to [5, 10]. In [4], Huang and Zhang obtained the invariance principle of the product of sums of random variables. It is perhaps worth to notice that by the strong law of large numbers and the property of the geometric mean it follows directly that
\[
\left( \frac{\prod_{k=1}^{n} S_k}{n!} \right)^{1/n} \overset{a.s.}{\longrightarrow} \mu
\] 
if only existence of the first moment is assumed. Very recently the first author [6, 7] obtained CLT and ASCLT for the product of some general partial sums.

The studies on the products of partial sums are usually concentrated on the classic limiting theory, such as, CLT, ASCLT, LIL. The main purpose of this short note is to establish an exponential convergence theorem for the product of sums of i.i.d. positive random variables.

2. Main results

2.1. A moderate deviation principle for the weighted sums

In this subsection, we establish a moderate deviation principle for the weighted sums which will play a key role in proving our main result.

**Lemma 2.1.** Let \((Y_n)_{n \geq 1}\) be a sequence of i.i.d. positive random variables with \(\mathbb{E}Y_1 = 0\) and \(\mathbb{E}(Y_1^2) = 1\). Assume that the sequence of positive numbers \((b_n)\) is the moderate deviation scale satisfying
\[
b_n \to \infty, \quad \frac{b_n \log n}{\sqrt{n}} \to 0, \text{ as } n \to \infty.
\]
If we suppose that the following exponential integrability condition holds: there exists a positive number \(\delta\) such that
\[
\mathbb{E} \exp \left( \delta |Y_1| \right) < \infty,
\] 
(2.1)
then for any \( r > 0 \),
\[
\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P} \left( \frac{1}{b_n \sqrt{2n}} \left| \sum_{i=1}^{n} b_{i,n} Y_i \right| \geq r \right) = -\frac{r^2}{2},
\]
where \( b_{i,n} = \sum_{k=i}^{n} \frac{1}{k} \), \( 1 \leq i \leq n \).

**Proof.** For any \( \lambda \in \mathbb{R} \), considering the following logarithmic moment generating function
\[
\Lambda_n(\lambda) := \log \mathbb{E} \exp \left( \frac{\lambda}{b_n \sqrt{2n}} \sum_{i=1}^{n} b_{i,n} Y_i \right)
\]
by the Gärtner-Ellis theorem \([2, 12]\), we need to calculate the following limit,
\[
\Lambda(\lambda) := \lim_{n \to \infty} \frac{1}{b_n^2} \Lambda_n(b_n^2 \lambda).
\]

From the independence, Taylor formula and the condition (2.1), for all \( n \) large enough, we obtain
\[
\frac{1}{b_n^2} \Lambda_n(b_n^2 \lambda) = \frac{1}{b_n^2} \log \mathbb{E} \exp \left( \frac{\lambda b_n}{\sqrt{2n}} \sum_{i=1}^{n} b_{i,n} Y_i \right)
\]
\[
= \frac{1}{b_n^2} \log \mathbb{E} \exp \left( \frac{\lambda b_n}{b_{i,n} \sqrt{2n}} b_{i,n} Y_i \right)
\]
\[
= \frac{1}{b_n^2} \log \left( 1 + \frac{\lambda b_n}{b_{i,n} \sqrt{2n}} b_{i,n} \mathbb{E} Y_i + \frac{\lambda^2 b_n^2 b_{i,n}^2 \mathbb{E} Y_i^2}{4n} + o \left( \frac{b_n^2 b_{i,n}^2}{n} \right) \right).
\]
Since \( \mathbb{E} Y_i = 0 \), \( \mathbb{E} Y_i^2 = 1 \), and the following fact
\[
\sum_{i=1}^{n} b_{i,n}^2 = b_{1,n} + 2 \sum_{k=2}^{n} \frac{k-1}{k} = b_{1,n} + 2 \sum_{k=2}^{n} \frac{k-1}{k} = 2n - b_{1,n} = 2n - \sum_{i=1}^{n} \frac{1}{i},
\]
we have
\[
\lim_{n \to \infty} \frac{1}{b_n^2} \Lambda_n(b_n^2 \lambda) = \lim_{n \to \infty} \frac{\lambda^2}{4n} \sum_{i=1}^{n} b_{i,n}^2 = \lim_{n \to \infty} \frac{\lambda^2}{4n} \left( 2n - \sum_{i=1}^{n} \frac{1}{i} \right) = \frac{\lambda^2}{2}.
\]
By the Gärtner-Ellis theorem, the desired result can be obtained. \( \blacksquare \)

### 2.2. Moderate deviation principle for the product of sums

**Theorem 2.2.** Let \((X_n)_{n \geq 1}\) be a sequence of i.i.d. positive random variables. Denote \( \mu = \mathbb{E}(X_1) > 0 \), the coefficient of variation \( \gamma = \sigma/\mu \), where \( \sigma^2 = \text{Var}(X_1) \), and \( S_k = X_1 + \cdots + X_k \), \( k = 1, 2, \ldots \). In addition, assume that the sequence of positive numbers \((b_n)\) is the moderate deviation scale satisfying
\[
b_n \to \infty, \quad \frac{b_n \log n}{\sqrt{n}} \to 0, \quad \text{as} \quad n \to \infty.
\]
If there exists a sequence of positive real numbers \((\alpha_n)\) such that
\[
\alpha_n \to \infty, \quad \frac{\alpha_n}{b_n \sqrt{n}} \to \infty, \quad \frac{\alpha_n}{n} \to 0, \quad \frac{\sqrt{n} \log n}{\alpha_n b_n} \to 0, \quad (2.2)
\]
and for all \(t > 0\)
\[
\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P}\left( \frac{1}{b_n \sqrt{n}} \sum_{i=1}^{\alpha_n} \log \frac{S_k}{k} \geq t \right) = -\infty, \quad (2.3)
\]
then we have for any \(r \geq 1\),
\[
\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P}\left( \prod_{k=1}^{\alpha_n} \frac{S_k}{n^{1/\mu_n}} \geq r \right) = -\frac{\log(r)^2}{2}; \quad (2.4)
\]
and for any \(0 < r < 1\),
\[
\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P}\left( \prod_{k=1}^{\alpha_n} \frac{S_k}{n^{1/\mu_n}} \leq r \right) = -\frac{\log(r)^2}{2}. \quad (2.5)
\]

**Proof.** Without loss of generality, let \(\mu = 1, \sigma^2 = 1\), then \(\gamma = 1\). Let \(C_k = S_k/k, k = 1, 2, \ldots\). For any \(r > 0, 0 < \varepsilon < 1/2\), it follows that
\[
\mathbb{P}\left( \frac{1}{b_n \sqrt{2n}} \sum_{k=1}^{\alpha_n} \log(C_k) \geq r \right)
\]
\[
= \mathbb{P}\left( \frac{1}{b_n \sqrt{2n}} \sum_{k=1}^{\alpha_n} \log(C_k) \geq r, \max_{\alpha_n \leq k \leq n} |C_k - 1| \geq \varepsilon \right) + \mathbb{P}\left( \frac{1}{b_n \sqrt{2n}} \sum_{k=1}^{\alpha_n} \log(C_k) \geq r, \max_{\alpha_n \leq k \leq n} |C_k - 1| < \varepsilon \right)
\]
\[
= A_n + B_n. \quad (2.6)
\]

By the comparison inequality in [8, Corollary 4], for any \(\varepsilon > 0\), it is obvious that
\[
\mathbb{P}\left( \max_{\alpha_n \leq k \leq n} \left| \frac{S_k}{k} - 1 \right| \geq \varepsilon \right) \leq \mathbb{P}\left( \max_{\alpha_n \leq k \leq n} \left| \sum_{i=1}^{k} (X_i - 1) \right| \geq \alpha_n \varepsilon \right)
\]
\[
\leq c \mathbb{P}\left( \sum_{i=1}^{n} (X_i - 1) \geq \alpha_n \varepsilon / c \right)
\]
\[
= c \mathbb{P}\left( \frac{1}{b_n \sqrt{n}} \sum_{i=1}^{n} (X_i - 1) \geq \frac{\alpha_n \varepsilon}{b_n \sqrt{n} c} \right). \quad (2.7)
\]

where \(c > 0\) is a constant. From the assumption \(\frac{\alpha_n}{b_n \sqrt{n}} \to \infty (n \to \infty)\) and the classic moderate deviation principle (cf. [2, 12]), it follows that for any \(\varepsilon > 0\),
\[
\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P}\left( \max_{\alpha_n \leq k \leq n} \left| \frac{S_k}{k} - 1 \right| \geq \varepsilon \right) = -\infty. \quad (2.8)
\]
From this we know that the term $A_n$ in (2.6) is negligible in the sense of the moderate deviation principle. To estimate the term $B_n$, we will expand the logarithm: $\log(1 + x) = x - \frac{x^2}{1 + \theta x^2}$, where $\theta \in (0, 1)$ depends on $x \in (-1/2, 1/2)$. Let $E_n$ denote the event $\{\max_{\alpha_n \leq k \leq n} |C_k - 1| < \varepsilon\}$, thus

$$B_n = \mathbb{P}\left(\frac{1}{b_n \sqrt{2n}} \sum_{k=1}^{n} \log(C_k) \geq r, \max_{\alpha_n \leq k \leq n} |C_k - 1| < \varepsilon\right)$$

$$= \mathbb{P}\left(\frac{1}{b_n \sqrt{2n}} \left(\sum_{k=1}^{\alpha_n} \log(C_k) + \sum_{k=\alpha_n+1}^{n} (C_k - 1) \right) - \sum_{k=\alpha_n+1}^{n} \frac{(C_k - 1)^2}{(1 + \theta_k (C_k - 1))^2} \geq r, E_n\right)$$

$$= \mathbb{P}\left(\frac{1}{b_n \sqrt{2n}} \left(\sum_{k=1}^{\alpha_n} \log(C_k) + \sum_{k=\alpha_n+1}^{n} (C_k - 1) \right) \geq r, E_n\right)$$

$$- \mathbb{P}\left(\frac{1}{b_n \sqrt{2n}} \left(\sum_{k=1}^{\alpha_n} \log(C_k) + \sum_{k=\alpha_n+1}^{n} (C_k - 1) \right) \geq r, E_n\right)$$

$$=: D_n - F_n.$$ 

By the same reason as for the term $A_n$, we know that the term $F_n$ is also negligible in the sense of the moderate deviation principle. Furthermore, by the condition (2.3), the term $\frac{1}{b_n \sqrt{2n}} |\sum_{k=1}^{\alpha_n} \log(C_k)|$ is negligible with respect to the moderate deviation principle. Similarly as for (2.7), we know that $\frac{1}{b_n \sqrt{2n}} |\sum_{k=1}^{\alpha_n} (C_k - 1)|$ can be neglected in the sense of the moderate deviation principle, so, from Lemma 2.1, we have

$$\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P}\left(\frac{1}{b_n \sqrt{2n}} \sum_{k=\alpha_n+1}^{n} (C_k - 1) \geq r\right) = -\frac{r^2}{2}.$$ 

Next if we can prove the claim: for any $\varepsilon > 0$,

$$\lim_{n \to \infty} \frac{1}{b_n^2} \log \mathbb{P}\left(\frac{1}{b_n \sqrt{n}} \left(\sum_{k=\alpha_n+1}^{n} \frac{(C_k - 1)^2}{(1 + \theta_k (C_k - 1))^2} \right) I_{E_n} \geq \varepsilon\right) = -\infty,$$ 

then the desired results can be obtained. Note that for $|x| < 1/2$ and any $\theta_k \in (0, 1)$, it follows that $\frac{x^2}{(1 + \theta x^2)^2} \leq 4x^2$. Therefore we have

$$\mathbb{P}\left(\frac{1}{b_n \sqrt{n}} \left(\sum_{k=\alpha_n+1}^{n} \frac{(C_k - 1)^2}{(1 + \theta_k (C_k - 1))^2} \right) I_{E_n} \geq 4\varepsilon\right) \leq \mathbb{P}\left(\frac{1}{b_n \sqrt{n}} \sum_{k=\alpha_n+1}^{n} (C_k - 1)^2 \geq \varepsilon\right).$$ 

By Theorem 15 and Lemma 5 in [9, Chapter III], for all $n$ sufficiently large, it follows that

$$\mathbb{P}\left(\frac{1}{b_n \sqrt{n}} \sum_{k=\alpha_n+1}^{n} (C_k - 1)^2 \geq \varepsilon\right) \leq \mathbb{P}\left(\frac{1}{k} \sum_{i=1}^{k} X_i - 1 \geq \sqrt{\frac{\varepsilon b_n}{n}}\right)$$

$$\leq 2 \sum_{k=\alpha_n}^{n} \exp\left(-c \frac{b_n}{\sqrt{n}}\right) \left(1 - \frac{c b_n}{\sqrt{n}}\right)^{-1} \exp\left(-c \frac{\alpha_n b_n}{\sqrt{n}}\right)$$

$$\leq 4 \frac{4}{c \frac{b_n}{\sqrt{n}} - \frac{1}{2} (c \frac{b_n}{\sqrt{n}})^2} \exp\left(-c \frac{\alpha_n b_n}{\sqrt{n}}\right) \leq 8n \exp\left(-c \frac{\alpha_n b_n}{\sqrt{n}}\right).$$
where $c$ is a positive constant. Therefore we have

$$\frac{1}{b_n^2} \log P\left( \frac{1}{b_n \sqrt{n}} \sum_{k=\alpha_n+1}^{n} (C_k - 1)^2 \geq \varepsilon \right) \leq -c \frac{\alpha_n}{b_n \sqrt{n}} \log \left( \frac{4n}{\alpha_n} \right) \to -\infty.$$  

Thus the claim (2.9) holds. ■

**Remark 2.3.** If the sequence $(b_n)$ satisfies $\frac{b_n^2}{\log n} \to \infty$, then there exists affirmatively a sequence $(\alpha_n)$ with the properties (2.2).

**Remark 2.4.** By the Jensen’s inequality, we have

$$\frac{1}{\alpha_n} \sum_{k=1}^{\alpha_n} \log \frac{S_k}{k} \leq \log \left( \frac{1}{\alpha_n} \sum_{k=1}^{\alpha_n} \frac{S_k}{k} \right), \quad \log \frac{S_k}{k} \geq \frac{1}{k} \sum_{i=1}^{k} \log X_i, \quad a.e.$$  

Hence, in order to make the condition (2.3) hold, it is sufficient to show the following relations: for any $t > 0$,

$$\frac{1}{b_n^2} \log P\left( \frac{\alpha_n}{\alpha_n} \sum_{i=1}^{\alpha_n} \frac{S_k}{k} \geq e^{\frac{\log n}{\alpha_n}} \right) = \frac{1}{b_n^2} \log P\left( \frac{\alpha_n}{\alpha_n} \sum_{i=1}^{\alpha_n} b_{i, \alpha_n} X_i \geq e^{\frac{\log n}{\alpha_n}} \right) \to -\infty,$$

and

$$\frac{1}{b_n^2} \log P\left( -\frac{\alpha_n}{\alpha_n} \sum_{i=1}^{\alpha_n} \log X_i \geq tb_n \sqrt{n} \right) = \frac{1}{b_n^2} \log P\left( -\frac{\alpha_n}{\alpha_n} \sum_{i=1}^{\alpha_n} b_{i, \alpha_n} \log X_i \geq tb_n \sqrt{n} \right) \to -\infty,$$

where $b_{i, \alpha_n} = \sum_{k=1}^{\alpha_n} \frac{1}{k}.$

**Example 2.5.** (Bounded random variables) Let $(X_n)$ be a sequence of i.i.d. bounded random variables with $a < X_1 < b$, where $0 < a < b < \infty$. If $\frac{\log n}{b_n^2} \to 0$ then the assumption (2.3) holds.

Noting $\mathbb{E} \log X_1 \leq \log \mathbb{E} X_1 = 0$, for any $t > 0$, let $t_n = tb_n \sqrt{n} / (4|\mathbb{E} \log X_1|)$, then by the Hoeffding’s inequality and the facts $\sum_{i=1}^{t_n} b_{i,t_n} = t_n$, $\sum_{i=1}^{t_n} b_{i,t_n}^2 \sim 2t_n$, there exists a constant $c > 0$ such that

$$P\left( \frac{1}{b_n \sqrt{n}} \sum_{i=1}^{t_n} \log \frac{S_k}{k} \leq -t \right) \leq P\left( -\sum_{k=1}^{t_n} \frac{1}{k} \sum_{i=1}^{k} \log X_i \geq \frac{tb_n \sqrt{n}}{2} \right)$$

$$= P\left( -\sum_{i=1}^{t_n} b_{i,t_n} \log X_i - \mathbb{E} \log X_i \geq \frac{tb_n \sqrt{n}}{4} \right) \leq e^{-cb_n \sqrt{n}} \quad (2.10)$$

and, by the inequality $e^{-x} \leq 1 - x + \frac{1}{2} x^2, x > 0$, for all $n$ large enough

$$P\left( \frac{1}{b_n \sqrt{n}} \sum_{k=t_n+1}^{\alpha_n} \log \frac{S_k}{k} \leq -t \right) \leq \sum_{k=t_n+1}^{\alpha_n} P\left( -\frac{S_k}{k} \geq \frac{tb_n \sqrt{n}}{2\alpha_n} \right).$$
Exponential convergence rate for products of sums

\[
\sum_{k=t_n+1}^{\alpha_n} P\left(1 - \frac{S_k}{k} \geq 1 - e^{-\frac{tb_n\sqrt{n}}{4\alpha_n}}\right) \\
\leq \sum_{k=t_n+1}^{\alpha_n} P\left(1 - \frac{S_k}{k} \geq \frac{tb_n\sqrt{n}}{4\alpha_n}\right) \leq \alpha_n e^{-ct_n\frac{t^2_n}{\alpha_n}}.
\]

Hence if we take \(\alpha_n = b_n\sqrt{n}(\log n)^{1/2}\), then

\[
\lim_{n\to\infty} \frac{1}{b_n^2} \log P\left(\frac{1}{b_n\sqrt{n}} \sum_{i=1}^{t_n} \log S_k \leq -t\right) = -\infty.
\]

Moreover, by the inequality \(1 + x \leq e^x, x \geq 0\), then

\[
\frac{1}{b_n^2} \log P\left(\frac{1}{\alpha_n} \sum_{i=1}^{\alpha_n} b_{i,\alpha_n} X_i \geq e^{-\frac{tb_n\sqrt{n}}{\alpha_n}}\right) \\
\leq \frac{1}{b_n^2} \log P\left(\frac{1}{\alpha_n} \sum_{i=1}^{\alpha_n} b_{i,\alpha_n} (X_i - 1) \geq \frac{tb_n\sqrt{n}}{\alpha_n}\right) \to -\infty
\]

by the Hoeffding’s inequality again. So from the above discussions, the condition (2.3) holds.

**Example 2.6.** (Exponential random variable) Let \((X_n)\) be a sequence of i.i.d. exponential random variables with density function \(f(x) = e^{-x}, x > 0\). If \(\frac{\log n}{n^2} \to 0\), by using the exponential inequalities in [9, Chapter III], it is not difficult to get the inequalities (2.10)-(2.12), which yields the condition (2.3). So we omit these proofs.
