INFINITELY MANY WEAK SOLUTIONS FOR SOME ELLIPTIC PROBLEMS IN $\mathbb{R}^N$

Mehdi Khodabakhshi, Abdolmohammad Aminpour, and Mohamad Reza Heidari Tavani

Abstract. We investigate the existence of infinitely many weak solutions to some elliptic problems involving the $p$-Laplacian in $\mathbb{R}^N$ by using variational method and critical point theory.

1. Introduction

We are going to establish infinitely many weak solutions to the following elliptic problem:

$$
-\Delta_p u + |u|^{p-2}u = \lambda f(x, u), \quad \text{in } \mathbb{R}^N,
$$

$$
u \in W^{1,p}(\mathbb{R}^N)
$$

where $N > 1$, $\Delta_p u := \text{div}(\nabla |\nabla u|^{p-2})$ denotes the $p$-Laplace operator with $p > N$, and $f : \mathbb{R}^N \times \mathbb{R} \rightarrow \mathbb{R}$ be an $L^1$-Carathéodory function, $\lambda$ is a positive real parameter. Problems on unbounded domains have been intensively studied. For instance, we mention the works [1–3, 9–12]. In [8] Condito and Molica Bisci considered problem (1.1) by taking $f(x, u) := \alpha(x)f(u)$, where $f : \mathbb{R} \rightarrow \mathbb{R}$ is a continuous function, $\alpha \in L^1(\mathbb{R}^N)$ and nonnegative (not identically zero) map. It should be mentioned the different cases of problem (1.1) and even in general have been considered on the variety of bounded domains. We just refer in the large literature on the subject, the papers [5, 6, 13–15]. For instance, in [14] the authors have studied the following elliptic problem of Kirchhoff type:

$$
-\left(a + b \int_{\Omega} |\nabla u|^p \, dx\right)\Delta_p u + \alpha(x)|u|^{p-2}u = \lambda h(x)f(x) \quad \text{in } \Omega,
$$

$$
u|_{\partial \Omega} = 0,
$$

where $a$ and $b$ are two non-negative constant, $\alpha \in L^\infty(\Omega)$ with ess inf_{x \in \Omega} \alpha(x) \geq 0$, $\lambda$ is a positive parameter, $f : \mathbb{R} \rightarrow \mathbb{R}$ is a continuous function and finally, $h \in L^\infty(\Omega)$.

with \( \text{ess inf } x \in \Omega h(x) > 0 \). Recall that a function \( f: \mathbb{R}^N \times \mathbb{R} \rightarrow \mathbb{R} \) is said to be an \( L^1 \)-Carathéodory function, if \((C_1)\) the function \( x \mapsto f(x, t) \) is measurable for every \( t \in \mathbb{R} \) \((C_2)\) the function \( t \mapsto f(x, t) \) is continuous for almost every \( x \in \mathbb{R}^N \) \((C_3)\) for every \( \varrho > 0 \) there exists a function \( l_\varrho(x) \in L^1(\mathbb{R}^N) \) such that
\[
\sup_{|t| \leq \varrho} |f(x, t)| \leq l_\varrho(x),
\]
for a.e. \( x \in \mathbb{R}^N \).

2. Preliminaries

Let \( N > 1 \), denote by \( X \) the space \( W^{1,p}(\mathbb{R}^N) \) endowed with the norm
\[
\|u\| := \left( \int_{\mathbb{R}^N} |\nabla u(x)|^p \, dx + \int_{\mathbb{R}^N} |u(x)|^p \, dx \right)^{1/p}.
\]
Let \( p > N \), we recall continuous embedding \( W^{1,p}(\mathbb{R}^N) \hookrightarrow L^\infty(\mathbb{R}^N) \), and one has
\[
\|u\|_\infty \leq \frac{2p}{p - N} \|u\|,
\]
for every \( u \in W^{1,p}(\mathbb{R}^N) \) (see \[7\] Morrey’s theorem). Let us define \( F(x, \xi) = \int_0^1 f(x, t) \, dt \), for every \( (x, \xi) \in \mathbb{R}^N \times \mathbb{R} \), and introduce the functional \( I_\lambda: X \rightarrow \mathbb{R} \) associated with \( (1.1) \),
\[
I_\lambda(u) := \Phi(u) - \lambda \Psi(u), \quad (\forall u \in X)
\]
where
\[
\Phi(u) = \frac{1}{p} \|u\|^p, \quad \Psi(u) = \int_{\mathbb{R}^N} F(x, u(x)) \, dx
\]
for every \( u \in X \). Now, in \[8\], it is shown that \( \Phi \) is a Gâteaux differentiable and sequentially weakly lower semicontinuous and coercive in \( X \) whose Gâteaux derivative is given by
\[
\Phi'(u)(v) = \int_{\mathbb{R}^N} |\nabla u(x)|^{p-2} \nabla u(x) \cdot \nabla v(x) \, dx + \int_{\mathbb{R}^N} |u(x)|^{p-2} u(x)v(x) \, dx,
\]
In this section, we summarize the for every \( v \in X \). On the other hand, standard arguments show that \( \Psi \) is a well defined, Gâteaux differentiable and sequentially weakly upper semicontinuous functional whose Gâteaux derivative is given by
\[
\Psi'(u)(v) = \int_{\mathbb{R}^N} f(x, u(x)) \, dx,
\]
for every \( v \in X \). Fixing the real parameter \( \lambda \), a function \( u: \mathbb{R}^N \rightarrow \mathbb{R} \) is said to be a weak solution of \( (1.1) \) if \( u \in X \) and
\[
\int_{\mathbb{R}^N} |\nabla u(x)|^{p-2} \nabla u(x) \cdot \nabla v(x) \, dx + \int_{\mathbb{R}^N} |u(x)|^{p-2} u(x)v(x) \, dx - \lambda \int_{\mathbb{R}^N} f(x, u(x))v(x) \, dx = 0,
\]
for every \( v \in X \). Hence, the critical points of \( I_\lambda \) are exactly the weak solutions of \( (1.1) \). Our main tool to investigate the existence of infinitely many weak solutions to the problem \( (1.1) \) is the following critical points theorem.
**Theorem 2.1.** [4, Theorem 2.1] Let $X$ be a reflexive real Banach space, and let $\Phi, \Psi : X \to \mathbb{R}$ be two Gâteaux differentiable functionals such that $\Phi$ is strongly continuous, sequentially weakly lower semicontinuous, coercive and $\Psi$ is sequentially weakly upper semicontinuous. For every $r > \inf_X \Phi$, put

$$
\varphi(r) := \inf_{\varphi(v) < r} \frac{\sup_{\varphi(u) < r} \Psi(u) - \Psi(v)}{r - \Phi(v)}
$$

and

$$
\gamma := \liminf_{r \to +\infty} \varphi(r), \quad \delta := \liminf_{r \to (\inf_X \Phi)^+} \varphi(r).
$$

then, one has

(a) For every $r > \inf_X \Phi$ and $\lambda \in [0, 1/\Phi(r)]$, the restriction of the functional $I_\lambda = \Phi - \lambda \Psi$ to $\Phi^{-1}[-\infty, r]$ admits a global minimum, which is a critical point (local minimum) of $I_\lambda$ in $X$.

(b) If $\gamma < +\infty$, then for each $\lambda \in [0, 1/\gamma]$, the following alternative holds: either

\begin{itemize}
  \item [\(b_1\)] $I_\lambda$ possesses a global minimum, or
  \item [\(b_2\)] there is a sequence $\{u_n\}$ of critical points (local minima) of $I_\lambda$ such that $\lim_{n \to \infty} \Phi(u_n) = +\infty$.
\end{itemize}

(c) If $\delta < +\infty$, then for each $\lambda \in [0, 1/\delta]$, the following alternative holds: either

\begin{itemize}
  \item [\(c_1\)] there is a global minimum of $\Phi$ which is a local minimum of $I_\lambda$, or
  \item [\(c_2\)] there is a sequence $\{u_n\}$ of pairwise distinct critical points (local minima) of $I_\lambda$ which weakly converges to a global minimum of $\Phi$, with $\lim_{n \to \infty} \Phi(u_n) = \inf_X \Phi$.
\end{itemize}

3. Main results

Fix $D > 0$ such that

$$
\kappa := \frac{1}{m(D)(\frac{2N}{p-N})^p (\frac{\sigma(N,p)}{p} + g(p,N))},
$$

where $\sigma(N,p) := 2^p - N(2^N - 1)$, as well as

$$
g(p,N) := \frac{1 + 2^{N+p} \int_0^1 t^{N-1}(1-t)^p dt}{2^N}.
$$

We also note that $m(D) := D^N \frac{N}{\Gamma(1+\frac{N}{p})}$, where $\Gamma$ is the Gamma function defined by

$$
\Gamma(t) := \int_0^{+\infty} z^{t-1} e^{-z} dz, \quad (\forall t > 0).
$$

**Theorem 3.1.** Let $f : \mathbb{R}^N \times \mathbb{R} \to \mathbb{R}$ be an $L^1$-Carathéodory function, and assume that

\begin{itemize}
  \item [i)] $F(x,t) \geq 0$ for every $(x,t) \in \mathbb{R}^N \times \mathbb{R}^+$;
  \item [ii)] $A := \liminf_{r \to +\infty} \frac{\|f(x,r)\|_{L^1}^p}{\Phi(r)} < \kappa B$,
\end{itemize}

where $B := \limsup_{\rho \to +\infty} \frac{1}{\rho^2} \int_{B(0, \rho)} F(x, \rho) \, dx$ and $l_\rho \in L^1(\mathbb{R}^N)$ that satisfies (c3) condition on $f(x, t)$ for every $\rho > 0$ and $\kappa$ is given by (3.1). Then for every

$$\lambda \in \left[ \frac{m(D)}{B} \left( \frac{\sigma(N, p)}{pD^p} + \frac{g(p, N)}{p} \right), \frac{1}{p(p - N)^p} A \right]$$

the problem (1.1) admits a sequence of many weak solutions which is unbounded in $X$.

**Proof.** Fix $\lambda$ as in our conclusion. Our aim is to apply Theorem 2.1 part (b) with $X = W^{1, p}(\mathbb{R}^N)$, and $\Phi, \Psi$ are the functionals introduced in Section 2. As seen before, the functionals $\Phi$ and $\Psi$ satisfy all regularity assumptions requested in Theorem 2.1. Now, we look on the existence of critical points of the functional $I_\lambda$ in $X$. To this end, we take $\{\rho_n\}$ to be a real sequence such that $\lim_{n \to \infty} \rho_n = +\infty$ and

$$\lim_{n \to \infty} \frac{\|\rho_n\|_1}{\rho_n} = A.$$

Set $r_n := \rho_n^p / (\frac{2p}{p - N})^p$, for every $n \in \mathbb{N}$. By relation (1.1), one has $\|v\|_p \leq \rho_n$ for all $v \in X$ such that $\|v\|_p < pr_n$, we have the following inequalities:

$$\varphi(r_n) = \inf_{\|u\|_p < pr_n} \sup_{\|v\|_p < pr_n} \int_{\mathbb{R}^N} F(x, v(x)) \, dx - \int_{\mathbb{R}^N} F(x, u(x)) \, dx = \frac{r_n - \|v\|_p}{pr_n} \leq p \left( \frac{2p}{p - N} \right)^p \frac{\|\rho_n\|_1}{\rho_n^{p-1}},$$

for every $n \in \mathbb{N}$. Hence, it follows that

$$\gamma \leq \lim_{n \to \infty} \inf \Phi(r_n) \leq p \left( \frac{2p}{p - N} \right)^p A < +\infty,$$

since condition ii) shows $A < +\infty$. Now, we prove that the functional $I_\lambda$ is unbounded from below. For our goal, let $\{d_n\}$ be a real sequence such that $\lim_{n \to \infty} d_n = +\infty$ and

$$\lim_{n \to +\infty} \frac{1}{d_n^p} \int_{B(0, \frac{d_n}{2})} F(x, d_n) \, dx = B.$$

Let $\{v_n\}$ be a sequence in $X$ which is defined by

$$v_n(x) := \begin{cases} 0 & x \in \mathbb{R}^N \setminus B(0, D) \\
 d_n & x \in B(0, \frac{d_n}{2}) \\
 2d_n(D - |x|) & x \in B(0, D) \setminus B(0, \frac{d_n}{2}). \end{cases}$$

One can compute that

$$\|v_n\|^p = d_n^p m(D) \left( \frac{\sigma(N, p)}{D^p} + g(p, N) \right),$$

see for instance, the paper [8]. At this point, by using condition i), we infer

$$\int_{\mathbb{R}^N} F(x, v_n(x)) \, dx \geq \int_{B(0, \frac{d_n}{2})} F(x, d_n) \, dx,$$
for every \( n \in \mathbb{N} \). Then, we have
\[
I_\lambda(v_n) \leq \frac{d^p_n m(D)}{p} \left( \frac{\sigma(N,p)}{D^p} + g(p,N) \right) - \lambda \int_{B(0,D)} F(x,d_n) \, dx,
\]
for every \( n \in \mathbb{N} \). If \( B < +\infty \), let
\[
\epsilon \in \left[ \frac{m(D)}{\lambda B} \left( \frac{\sigma(N,p)}{pD^p} + \frac{g(p,N)}{p} \right), 1 \right].
\]
By (3.2) there exists \( N_\epsilon \) such that
\[
\int_{B(0,D)} F(x,d_n) \, dx > \epsilon B d_n, \quad (\forall n > N_\epsilon).
\]
Consequently, one has
\[
I_\lambda(v_n) \leq \frac{d^p_n m(D)}{p} \left( \frac{\sigma(N,p)}{D^p} + g(p,N) \right) - \lambda \epsilon B d_n,
\]
for every \( n > N_\epsilon \). Thus, it follows that
\[
\lim_{n \to \infty} I_\lambda(v_n) = -\infty.
\]
If \( B = +\infty \), let us consider
\[
M > \frac{m(D)}{\lambda p} \left( \frac{\sigma(N,p)}{pD^p} + g(p,N) \right).
\]
By (3.2) there exists \( N(M) \) such that
\[
\int_{B(0,D)} F(x,d_n) \, dx > M d_n, \quad (\forall n > N(M)).
\]
Hence, we have
\[
I_\lambda(v_n) \leq \frac{d^p_n m(D)}{p} \left( \frac{\sigma(N,p)}{D^p} - g(p,N) \right) - \lambda M d_n
\]
\[
= \frac{d^p_n}{p} \left( m(D) \left( \frac{\sigma(N,p)}{pD^p} + \frac{g(p,N)}{p} \right) - \lambda M \right),
\]
for every \( n > N(M) \). Taking into account the choice of \( M \), also in this case, one has
\[
\lim_{n \to \infty} I_\lambda(v_n) = -\infty.
\]
Thanks to Theorem 2.1, the functional \( I_\lambda \) admits an unbounded sequence \( \{u_n\} \subset X \) of critical points. In conclusion, problem (1.1) admits a sequence of many weak solutions which is unbounded in \( W^{1,p}(\mathbb{R}^N) \). \( \square \)

The following result is a consequence of Theorem 3.1.

**Corollary 3.1.** Let \( f : \mathbb{R}^N \times \mathbb{R} \to \mathbb{R} \) be an \( L^1 \)-Carathéodory function. Assume that condition i) of Theorem 3.1 holds. Further, require that
\[
\text{ii) } \limsup_{\varrho \to +\infty} \frac{1}{\varrho^p} \int_{B(0,\varrho)} F(x,g) \, dx > \frac{m(D)}{p} \left( \frac{\sigma(N,p)}{D^p} + g(p,N) \right);
\]
\(\ii_2\) \(\liminf_{\text{e} \to +\infty} \frac{\|u\|_1}{\|u\|^p} < p \left(\frac{2n}{p-N}\right)^{-p}.\)

Then, the problem

\[-\Delta_p u + |u|^{p-2}u = f(x, u), \quad \text{in} \ \mathbb{R}^N,\]

\[u \in W^{1,p}(\mathbb{R}^N)\]

possesses a sequence of many weak solutions which is unbounded in \(W^{1,p}(\mathbb{R}^N)\).

Finally, We point out the following result.

**Corollary 3.2.** Let \(f: \mathbb{R}^N \times \mathbb{R} \to \mathbb{R}\) be an \(L^1\)-Carathéodory function. Assume that condition \(i\) of Theorem 3.1 holds. Further, require that

\[\limsup_{\text{e} \to +\infty} \frac{1}{\|u\|^p} \int_{B(0, \text{e})} F(x, u) \, dx = \infty, \quad \liminf_{\text{e} \to +\infty} \frac{\|u\|_1}{\|u\|^p} = 0,\]

Then, for every \(\lambda > 0\), the problem

\[-\Delta_p u + |u|^{p-2}u = \lambda f(x, u), \quad \text{in} \ \mathbb{R}^N,\]

\[u \in W^{1,p}(\mathbb{R}^N)\]

possesses a sequence of many weak solutions which is unbounded in \(W^{1,p}(\mathbb{R}^N)\).

**Remark 3.1.** We note that assumption \(ii\) in Theorem 3.1 could be replaced by the following more general hypotheses:

\(\ii')\) There exists two sequences \(\{a_n\}\) and \(\{b_n\}\) such that

\[0 \leq a_n < \frac{(p-N)b_n}{2p\left(\sigma(N,p) + g(p, N)\right)^{\frac{1}{p}}},\]

for every \(n \in \mathbb{N}\) and \(\lim_{n \to \infty} b_n = +\infty\) such that

\[\hat{A} < \kappa \limsup_{e \to +\infty} \frac{1}{\|u\|^p} \int_{B(0, \text{e})} F(x, u) \, dx,\]

where \(\kappa\) is given by (3.1) and

\[\hat{A} := \lim_{n \to \infty} \frac{\|u\|_1}{\|u\|^p} \int_{B(0, \text{e})} F(x, u) \, dx p\left(\frac{2n}{p-N}\right)^p.\]

For instance, in this setting by choosing

\[\lambda \in \left[\frac{m(D)}{B} \left(\frac{\sigma(N, p)}{pD^p} + \frac{g(p, N)}{p}\right), \frac{1}{p\left(\frac{2n}{p-N}\right)^p} \hat{A}\right],\]

problem (1.1) admits a sequence of many weak solutions which is unbounded in \(W^{1,p}(\mathbb{R}^N)\). Indeed, if

\[\lambda \in \left[\frac{m(D)}{B} \left(\frac{\sigma(N, p)}{pD^p} + \frac{g(p, N)}{p}\right), \frac{1}{p\left(\frac{2n}{p-N}\right)^p} \hat{A}\right],\]
and $r_n := \frac{b_n}{p(\frac{2p}{p-N})}$ for every $n \in \mathbb{N}$, then one has

$$
\varphi(r_n) = \inf_{\|u\|_p < r_n} \sup_{\|v\|_p < r_n} \int_{\mathbb{R}^N} F(x, v(x)) \, dx - \int_{\mathbb{R}^N} F(x, u(x)) \, dx
$$

$$
\leq \sup_{\|v\|_p < r_n} \int_{\mathbb{R}^N} F(x, v(x)) \, dx - \int_{\mathbb{R}^N} F(x, v_n(x)) \, dx
$$

$$
\leq \left( b_n \|u_n\| + \int_{B(0, \frac{D}{2})} F(x, a_n) \, dx \right) p\left( \frac{2p}{p-N} \right)^p
$$

$$
\leq \left( \frac{2p}{p-N} \right)^p a_n^m(D) \left( \frac{2(N,p)}{p} + g(p, N) \right),
$$

by choosing

$$
v_n(x) := \begin{cases} 
0 & x \in \mathbb{R}^N \setminus B(0, D) \\
 a_n & x \in B(0, \frac{D}{2}) \\
 \frac{2a_n}{D}(D - |x|) & x \in B(0, D) \setminus B(0, \frac{D}{2})
\end{cases}
$$

for each $n \in \mathbb{N}$. Hence, by assumption ii') one has $\hat{A} < +\infty$, we obtain

$$
\gamma \leq \lim_{n \to \infty} \varphi(r_n) \leq p\left( \frac{2p}{p-N} \right)^p \hat{A} < +\infty.
$$

From now on, arguing as in the proof of Theorem 3.1, the conclusion follows.
