#### Abstract

Let $X$ be a minuscule homogeneous space, an odddimensional quadric, or an adjoint homogenous space of type different from $A$ and $G_{2}$. Le $C$ be an elliptic curve. In this paper, we prove that for $d$ large enough, the scheme of degree $d$ morphisms from $C$ to $X$ is irreducible, giving an explicit lower bound for $d$ which is optimal in many cases.

2010 Mathematics Subject Classification: 14M15, 14N35 Keywords and Phrases: Elliptic curves, minuscule homogeneous spaces, adjoint homogeneous spaces.

## Introduction

In this paper we study the scheme $\operatorname{Hom}_{d}(C, X)$ of degree $d$ morphisms from an elliptic curve $C$ to a rational homogeneous space $X$. Specifically we will assume that $X$ is either a minuscule homogeneous space or an adjoint homogeneous space. Minuscule homogeneous spaces ${ }^{1}$ are a natural generalisation of Grassmann varieties (see Table 1). Adjoint homogeneous spaces are also called quasi-minuscule and are obtained as the unique closed orbits in $\mathbb{P g}$ under the adjoint action. These varieties are also called minimal nilpotent orbits (see Table 2).
We prove that the scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible as soon as $d$ is large enough and we give an explicit bound $d(X)$ for $d$ (see Tables 1 and 2).

[^0]Theorem 0.1 Let $C$ be a smooth elliptic curve and let $X$ be a minuscule or an adjoint homogeneous space. If $X$ is of adjoint type, assume furthermore that the group $G$ is not of type $A$ or $G_{2}$. For $d \geq d(X)$, the scheme of morphisms $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $c_{1}(X) d$.

In many cases, we also prove that the bound $d(X)$ is optimal in the following sense: for $d<d(X)$, the scheme $\operatorname{Hom}_{d}(C, X)$ has dimension strictly bigger than the expected dimension $c_{1}(X) d$. Note that it may happen that for $d<$ $d(X)$ the scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible. This is the case for all $d$ when $X$ is isomorphic to the maximal isotropic Grassmann variety $\mathbb{G}_{Q}(n, 2 n)$ (see Table 1 and Corollary 3.9).

Remark 0.2 (1) Note that B. Kim and R. Pandharipande proved the connectedness of the moduli space of stable maps $\overline{\mathbf{M}}_{d, g}(X)$ to any homogeneous space and for any genus. However, this space is almost never irreducible since there will be irreducible components of unexpected dimension (see Proposition 4.2). (ı) Note also that for $d=2$, the scheme of morphisms $\operatorname{Hom}_{d}(C, X)$ to any homogeneous space with Picard rank 1 is irreducible of dimension $c_{1}(X)+$ $\operatorname{dim} X+1$. Indeed, any degree 2 morphism factors through a line.

Minuscule and adjoint homogeneous spaces are of the form $G / P$ for a semisimple algebraic group $G$. Except for the adjoint homogeneous space of type $A$, the parabolic subgroup $P$ is a maximal parabolic subgroup. This is the reason why we will assume that if $X$ is of adjoint type the group $G$ is not of type $A$. Recall that the Dynkin diagram of the group $G$ has vertices indexed by simple roots. In the following tables, we give the list of all minuscule homogeneous spaces. Note that we also include odd dimensional quadrics which are not minuscule but cominuscule. The above statement is still true for odd dimensional quadrics.
In Table 1, we give the list of all adjoint homogeneous spaces for a group of type different from $A$. In this table we also include the adjoint variety of type $G_{2}$ even though we have no result for this variety.
In these tables, we followed the notation of [Bou54, Tables] and we depicted the set $\Sigma(P)$ of simple roots not in $P$ with plain vertices. The minuscule and adjoint varieties $X=G / P$ are described in the second column. By convention we denote by $\mathbb{G}(k, n)$ (resp. $\left.\mathbb{G}_{Q}(k, n)\right)$ the Grassmann variety of $k$-dimensional subspaces in $\mathbb{C}^{n}$ (resp. isotropic $k$-dimensional subspaces in $\mathbb{C}^{n}$ for a nondegenerate quadratic form $Q$ in $\left.\mathbb{C}^{n}\right)$. For $\mathbb{G}_{Q}(n, 2 n)$ we only consider one of the two connected components of the above Grassmann variety. We denoted by $\mathbb{Q}_{m}$ any smooth $m$-dimensional quadric. The varieties $\mathbb{O P}^{2}=E_{6} / P_{1}$ and $E_{7} / P_{7}$ are the Cayley plane and the Freudenthal variety. Recall that the index of $X=G / P$ is the integer $c_{1}(X)$ such that the anticanonical divisor $-K_{X}$ equals $c_{1}(X) H$ where $H$ is an ample generator of the Picard group. The last column gives the bound $d(X)$ of our main theorem.

Remark 0.3 Note that the above statement was already known for Grassmann varieties by results of $A$. Bruguières [Bru87] and for quadrics by results of E .

Ballico [Bal89]. Note also that for orthogonal Grassmann varieties, the above result was obtained by another technique by the second author in the paper [Per12]. This case was the very first motivation for our study. It answered a question of D. Markushevitch and has been used in [IM07].

Remark 0.4 Note that the choice of minuscule and adjoint varieties for studying elliptic curves is not a random one. Indeed, already in the study of rational curves and their associated enumerative properties encoded in quantum cohomology, these variety have very special properties, see for example [Buc03, BKT03, BM11, BCMP10, CMP08, CMP07, CMP10] for minuscule homogeneous spaces and [CP11b] for adjoint varieties.

Let us briefly describe the content of the paper. The strategy of the proof relies on a description given in [Per02] of a big open cell $U$ in any homogeneous space $X$ as a tower of affine bundles $\phi: U \rightarrow Y$ (see Definition 1.2) where $Y$ is again homogeneous under a smaller group. In section 1 we explain how to restrict the study of the irreducibility of $\operatorname{Hom}_{d}(C, X)$ to the one of $\operatorname{Hom}_{d}(C, U)$ and we explain, under some conditions on the fibration $\phi: U \rightarrow Y$, how to deduce the irreducibility of $\operatorname{Hom}_{d}(C, U)$ from the irreducibility of $\operatorname{Hom}_{d}(C, Y)$. In section 1.3, we recall the construction of $U$ and of the the fibration $\phi: U \rightarrow Y$ and describe the tower of affine fibrations. In section 2 , we prove some results on the cohomology of the restriction to elliptic curves of equivariant locally free sheaves on projective spaces quadrics. In section 3, we gather all these results to prove Theorem 0.1. In section 4, we include some remarks on the moduli space of stable maps to minuscule or adjoint homogeneous spaces with source an elliptic curve. Finally, in an appendix we deal with the quadric of dimension 3, which we cannot approach by the same method as all other homogeneous spaces.

Acknowledgments. The second author would like to thank Christian Peskine for enlightening discussions on the paper [GLP83] and Piotr Achinger for useful comments on spinor bundles. Part of this work was done while both authors were supported by Hausdorff Center for Mathematics in Bonn. We thank the HCM for perfect working conditions.

## 1 Reduction of the theorem

### 1.1 Restriction to an open subset

Let $C$ be a smooth curve, let $X$ be a homogeneous space with Picard number 1 and let $\alpha \in A_{1}(X)$. The strategy of the proof will be similar to the one in [Per02]. We prove that there exists an open subset $U$ of $X$ whose complement is of codimension at least 2 and such that $U$ can be realised as a tower of affine bundles $\phi: U \rightarrow Y$ (See Definition 1.2 below) over a homogeneous space $Y$ of smaller dimension. The next result from [Per02, Proposition 2] proves that the irreducibility of $\operatorname{Hom}_{\alpha}(C, X)$ is equivalent to the irreducibility of $\operatorname{Hom}_{i^{*} \alpha}(C, U)$ (where $i: U \rightarrow X$ is the inclusion morphism). This result is an easy application of Kleiman-Bertini Theorem [Kle74].
Proposition 1.1 Let $C$ be a smooth curve and let $X$ be a homogeneous space under a group $G$. Assume that $U$ be an open subset of $X$ such that $\operatorname{Codim}_{X}(X \backslash$ $U) \geq 2$ and let $i: U \rightarrow X$ be the inclusion morphism. For $\alpha \in A_{1}(X)$, if $\operatorname{Hom}_{i^{*} \alpha}(C, U)$ is irreducible, then so is $\boldsymbol{H o m}_{\alpha}(C, X)$.
We then need to study the open subset $U$. It will be the open orbit of the action of some parabolic subgroup of $G$ on $X$. The second author proved in [Per02] that $U$ can be realised as a tower $\phi: U \rightarrow Y$ of affine bundles (see Definition 1.2) over a homogeneous space $Y$ of smaller dimension. However, if this was enough to study rational curves, we need to be more precise if we want to study higher genus curves. If $\phi: U \rightarrow Y$ is an affine bundle associated to a vector bundles $E$, we explain in the next subsection how a good understanding of the restriction of $E$ to higher genus curves in $Y$ enables us to proceed by induction on the dimension.

### 1.2 Passing through towers of affine bundles

Let us fix some notation. In this section $X$ is a homogeneous space of Picard number 1 , we denote by $U$ an open subset whose complement $Z$ is of codimension 2 and we assume that $U$ can be realised as a tower of affine bundles $\phi: U \rightarrow Y$ over a homogeneous space $Y$ of smaller dimension in the following sense.

Definition 1.2 Let $n$ be a non negative integer and for all $i \in[1, n-1]$, let $\phi_{i}: X_{i} \rightarrow X_{i+1}$ be an affine bundle. Let $U=X_{1}$ and $Y=X_{n}$. The composition morphism $\phi: U \rightarrow Y$ is called a tower of affine bundles over $Y$.

Note that because of the inequality $\operatorname{Codim}_{X} Z \geq 2$, we have $\operatorname{Pic}(U)=\operatorname{Pic}(X)$. Furthermore since $\phi: U \rightarrow Y$ is a tower of affine bundles, then we also have $\operatorname{Pic}(U)=\operatorname{Pic}(Y)$. For $f: C \rightarrow U$ a morphism, we may define a linear form $[f]$ on $\operatorname{Pic}(X)$ by $\mathcal{L} \mapsto \operatorname{deg}\left(f^{*} \mathcal{L}\right)$. We shall say that for $\alpha \in \operatorname{Pic}(X)^{\vee}$ a curve $f: C \rightarrow U$ is of class $\alpha$ if $[f]=\alpha$. We shall write $\langle\alpha, \mathcal{L}\rangle$ for the evaluation of $\alpha$ at $\mathcal{L} \in \operatorname{Pic}(X)$. For such a class $\alpha$ in $\operatorname{Pic}(X)^{\vee}$, we denote by $\operatorname{Hom}_{\alpha}(C, X)$ resp. $\operatorname{Hom}_{\alpha}(C, U), \operatorname{Hom}_{\alpha}(C, Y)$ the scheme of morphisms from $f: C \rightarrow X$ resp. $f: C \rightarrow U, f: C \rightarrow Y$ such that $[f]=\alpha$. Note that for $X$ (or for $Y$ ) we have identifications $A_{1}(X) \simeq \operatorname{Pic}(X)^{\vee}$ and $A_{1}(Y) \simeq \operatorname{Pic}(Y)^{\vee}$ and that these schemes of morphisms are the classical schemes of morphisms as defined in [Gro61].
We now prove a general result on the scheme of morphisms to an affine bundle. For this we introduce the following notation. Let $\phi: U \rightarrow Y$ be an affine bundle with direction vector bundle $E$ on $Y$ and let $\alpha \in \operatorname{Pic}(U)^{\vee}$. We denote by $\mathbf{H}_{b}$ the locally closed subset of $\operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$ defined by

$$
\mathbf{H}_{b}=\left\{f \in \mathbf{H o m}_{\phi_{*} \alpha}(C, Y) / \operatorname{dim} H^{1}\left(C, f^{*} E\right)=b\right\}
$$

Proposition 1.3 Let $\phi: U \rightarrow Y$ be an affine bundle over a variety $Y$ with direction vector bundle $E$. Let $\alpha \in \operatorname{Pic}(U)^{\vee}$ and let $C$ be a smooth curve such that the scheme $\operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$ is irreductible of dimension $\left\langle\phi_{*} \alpha, c_{1}\left(T_{Y}\right)\right\rangle$.
(乞) Assume that there exists $f \in \operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$ satisfying the vanishing $H^{1}\left(C, f^{*} E\right)=0$. If for all integer $b>0$ we have the inequality $\operatorname{Codim} \mathbf{H}_{b}>b$, then $\operatorname{Hom}_{\alpha}(C, U)$ is irreducible of dimension $\left\langle\alpha, c_{1}\left(T_{U}\right)\right\rangle$.
(u) Assume that $\phi$ is a vector bundle and let a be the smallest integer such that there exists an element $f \in \operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$ with $\operatorname{dim} H^{1}\left(C, f^{*} E\right)=a$. If there exists an integer $b>a$ satisfying the inequality $\operatorname{Codim} \mathbf{H}_{b} \leq b-a$, then the scheme $\mathbf{H o m}_{\alpha}(C, U)$ is reductible.

Proof. (1) Let us consider the natural morphism $\operatorname{Hom}_{\alpha}(C, U) \rightarrow$ $\operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$. As explained in [Per02] for rational curves, the fiber of this map over an element $f \in \operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$ is given by the sections $s \in H^{0}\left(C, f^{*} E\right)$. In particular, such a section exists if and only if the affine bundle $C \times_{Y} U \rightarrow C$ obtained by pull-back to $C$ is a vector bundle. For a
general element $f \in \operatorname{Hom}_{\phi_{*} \alpha}(C, Y)$ this is the case thanks to the vanishing $H^{1}\left(C, f^{*} E\right)=0$.
For $b>0$ the fibers over the locally closed subset $\mathbf{H}_{b}$ are either empty (if the pull-back is not a vector bundle) or of dimension $\operatorname{dim} H^{0}\left(C, f^{*} E\right)=$ $\chi\left(C, f^{*} E\right)+\operatorname{dim} H^{1}\left(C, f^{*} E\right)=\left\langle\phi_{*} \alpha, c_{1}(E)\right\rangle+b$. The dimension of the inverse image of $\mathbf{H}_{b}$ in $\operatorname{Hom}_{\alpha}(C, U)$ is therefore strictly less than $\left\langle\phi_{*} \alpha, c_{1}\left(T_{Y}\right)+\right.$ $\left.c_{1}(E)\right\rangle=\left\langle\alpha, c_{1}\left(T_{U}\right)\right\rangle$, which is the expected dimension of $\operatorname{Hom}_{\alpha}(C, U)$. As any irreducible component is at least of this expected dimension (cf. [Mor79]), these locally closed subsets do not form irreducible components. Therefore the inverse image of the open subset $\mathbf{H}_{0}$ is dense in $\operatorname{Hom}_{\alpha}(C, U)$. As explained in [Per02] for rational curves, this inverse image is an affine bundle over the base and is thus irreducible of dimension $\left\langle\phi_{*} \alpha, c_{1}\left(T_{Y}\right)+c_{1}(E)\right\rangle=\left\langle\alpha, c_{1}\left(T_{U}\right)\right\rangle$.
(11) In this case, the inverse image of the locally closed subset $\mathbf{H}_{a}$ is of dimension $\left\langle\alpha, c_{1}\left(T_{U}\right)\right\rangle+a$ while the inverse image of the locally closed subset $\mathbf{H}_{b}$ is of dimension at least $\left\langle\alpha, c_{1}\left(T_{U}\right)\right\rangle+a$. This second locally closed subset is therefore not contained in the closure of the first one, thus they have to be contained in two different irreducible components.

### 1.3 Decomposition of $X$

The aim of this subsection is to describe a big open cell $U$ in the homogeneous space $X$ and to realise it as a fibration $\phi: U \rightarrow Y$ over a space $Y$ homogeneous under a group of smaller rank. This fibration can be decomposed in general as a tower of affine bundles (see [Per02, Proposition 5]). Let us recall this result. Let $T$ be a maximal torus in $G$ and let $B$ be a Borel subgroup of $G$ containing $T$. Denote by $w_{0}$ the longest element of the Weyl group $W$ of $(G, T)$. For any subgroup $H$ of $G$, we set $H^{w_{0}}:=w_{0} H w_{0}^{-1}$ and for any parabolic subgroup $P$ of $G$ containing $B$, we denote by $L_{P}$ the Levi subgroup of $P$ containing $T$ and by $U_{P}$ the unipotent radical of $P$. We also denote by $\{1\}=U_{P}^{0} \subset U_{P}^{1} \subset \cdots \subset U_{P}^{r}$ the upper central series ${ }^{2}$ of the group $U_{P}$. For any parabolic subgroup $P$ containing $B$, we denote by $\Sigma(P)$ the set of simple roots which are not roots of $P$. Finally, for a simple root $\alpha$, we denote by $\iota(\alpha)$ its image via the Weyl involution i.e. $\iota(\alpha)=-w_{0}(\alpha)$.

Lemma 1.4 (Proposition 5 and 6, [Per02]) Let $P$ and $Q$ be two parabolic subgroups of $G$ containing $B$ and assume that $\iota(\Sigma(P)) \cap \Sigma(Q)=\emptyset$. Set $U:=$ $Q^{w_{0}} P / P$. Then $U$ is an open subset of $G / P$ with complement in codimension at least 2 and admits an $L_{Q^{w_{0}}}$ equivariant fibration $\phi: U \rightarrow Y$ over the flag variety $Y=L_{Q^{w_{0}}} /\left(L_{Q^{w_{0}}} \cap P\right)$. Moreover this fibration decomposes in a tower of affine bundles

$$
U=X_{1} \xrightarrow{\phi_{1}} X_{2} \xrightarrow{\phi_{2}} \cdots \xrightarrow{\phi_{r-2}} X_{r-1} \xrightarrow{\phi_{r-1}} X_{r}=Y
$$

[^1]such that the vector bundle associated to the affine bundle $\phi_{i}: X_{i} \rightarrow X_{i+1}$ is obtained by pull-back from $Y$ of the $L_{Q^{w_{0}}}$-equivariant vector bundles associated to the $L_{Q^{w_{0}}} \cap P$ representations $U_{Q^{w_{0}}}^{i} / U_{Q^{w_{0}}}^{i-1} \cdot\left(U_{Q^{w_{0}}}^{i} \cap P\right)$.

Remark 1.5 Note that it is easy to determine the weights of $T$ on the representation $U_{Q^{w_{0}}}^{i} / U_{Q^{w_{0}}}^{i+1} \cdot\left(U_{Q^{w_{0}}}^{i} \cap P\right)$ defining the vector bundle. For example for maximal parabolic subgroups $P$ and $Q$ with $\Sigma(P)=\left\{\alpha_{P}\right\}$ and $\Sigma(Q)=\left\{\alpha_{Q}\right\}$, the weights of the above representation are the negative roots $\alpha$ such that the coefficient of $\alpha$ on $\alpha_{P}$ is negative and the coefficient of $\alpha$ on $\alpha_{Q}$ is exactly $-i$.

Keeping the previous notation we deduce the existence of the following fibrations. In the next result we will use the description of simple roots given in [Bou54, Tables]

Corollary 1.6 We have the following fibrations.

1. If $G$ is of type $A_{n}$, if $\Sigma(P)=\left\{\alpha_{i}\right\}$ with $2 \leq i \leq n$ and if $\Sigma(Q)=$ $\left\{\iota\left(\alpha_{i-1}\right)\right\}$, then $Y$ is isomorphic to $\mathbb{P}^{n-i+1}$ and $\phi: U \rightarrow Y$ is the vector $\left(T_{\mathbb{P}^{n-i+1}}(-1)\right)^{\oplus i-1} \simeq\left(\Omega_{\mathbb{P}^{n-i+1}}^{n-i}(n-i+1)\right)^{\oplus i-1}$.
2. If $G$ is of type $B_{n}$, if $\Sigma(P)=\left\{\alpha_{1}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{n}\right\}$, then $Y$ is isomorphic to $\mathbb{P}^{n-1}$ and $\phi: U \rightarrow Y$ is a tower of affine fibrations whose direction vector bundles are pull-backs of $\mathcal{O}_{\mathbb{P}^{n-1}}(1)$ and $\Omega_{\mathbb{P}^{n-1}}^{1}(2)$.
3. If $G$ is of type $B_{n}$, if $\Sigma(P)=\left\{\alpha_{2}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{1}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{2 n-3}$ and $\phi: U \rightarrow Y$ is the vector bundle $\left(\mathcal{O}_{\mathbb{Q}_{2 n-3}}(1)\right)^{\perp}$ i.e. the restriction of the tautological quotient bundle on $\mathbb{P}^{2 n-2}$ to $\mathbb{Q}_{2 n-3}$.
4. If $G$ is of type $D_{n}$, if $\Sigma(P)=\left\{\alpha_{1}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{n}\right\}$, then $Y$ is isomorphic to $\mathbb{P}^{n-2}$ and $\phi: U \rightarrow Y$ is the vector bundle $\Omega_{\mathbb{P}^{n-2}}^{1}(2)$.
5. If $G$ is of type $D_{n}$, if $\Sigma(P)=\left\{\alpha_{2}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{1}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{2 n-4}$ and $\phi: U \rightarrow Y$ is the vector bundle $\left(\mathcal{O}_{\mathbb{Q}_{2 n-4}}(1)\right)^{\perp}$ i.e. the restriction of the tautological quotient bundle on $\mathbb{P}^{2 n-3}$ to $\mathbb{Q}_{2 n-4}$.
6. If $G$ is of type $D_{n}$, if $\Sigma(P)=\left\{\alpha_{n}\right\}$ and if $\Sigma(Q)=\left\{\iota\left(\alpha_{n-1}\right)\right\}$, then $Y$ is isomorphic to $\mathbb{P}^{n-1}$ and $\phi: U \rightarrow Y$ is the vector bundle $\Omega_{\mathbb{P}^{n-1}}^{n-3}(n-2)$.
7. If $G$ is of type $E_{6}$, if $\Sigma(P)=\left\{\alpha_{1}\right\}$ and if $\Sigma(Q)=\left\{\iota\left(\alpha_{6}\right)\right\}=\left\{\alpha_{1}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{8}$ and $\phi: U \rightarrow Y$ is one of the two spinor bundles on $\mathbb{Q}_{8}$.
8. If $G$ is of type $E_{6}$, if $\Sigma(P)=\left\{\alpha_{2}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{1}, \alpha_{6}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{6}$ and $\phi: U \rightarrow Y$ is a tower of affine bundles whose direction vector bundles are pull-backs of $E=\left(\mathcal{O}_{\mathbb{Q}_{6}}(1)\right)^{\perp}$ and $E^{\prime}=S \oplus S^{\prime}$ where $E$ is the restriction of the tautological quotient bundle of $\mathbb{P}^{7}$ to $\mathbb{Q}_{6}$ and $S$ and $S^{\prime}$ are the two spinor bundles on $\mathbb{Q}_{6}$.
9. If $G$ is of type $E_{7}$, if $\Sigma(P)=\left\{\alpha_{7}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{2}\right\}$, then $Y$ is isomorphic to $\mathbb{P}^{6}$ and $\phi: U \rightarrow Y$ is a tower of affine bundles whose direction vector bundles are pull-backs of $E=\Omega_{\mathbb{P}^{6}}^{5}(6)$ and $E^{\prime}=\Omega_{\mathbb{P}^{6}}^{2}(3)$.
10. If $G$ is of type $E_{7}$, if $\Sigma(P)=\left\{\alpha_{2}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{6}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{8}$ and $\phi: U \rightarrow Y$ is a tower of affine bundles whose direction vector bundles are pull-backs of $E=\left(\mathcal{O}_{\mathbb{Q}_{8}}(1)\right)^{\perp}$ and $E^{\prime}=S^{2}$ where $E$ is the restriction of the tautological quotient bundle of $\mathbb{P}^{9}$ to $\mathbb{Q}_{8}$ and $S$ is one of the two spinor bundles on $\mathbb{Q}_{8}$.
11. If $G$ is of type $E_{8}$, if $\Sigma(P)=\left\{\alpha_{8}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{1}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{12}$ and $\phi: U \rightarrow Y$ is a tower of affine bundles whose direction vector bundles are pull-backs of $E=\left(\mathcal{O}_{\mathbb{Q}_{12}}(1)\right)^{\perp}$ and $E^{\prime}=S$ where $E$ is the restriction of the tautological quotient bundle of $\mathbb{P}^{13}$ to $\mathbb{Q}_{12}$ and $S$ is one of the two spinor bundles on $\mathbb{Q}_{12}$.
12. If $G$ is of type $F_{4}$, if $\Sigma(P)=\left\{\alpha_{1}\right\}$ and if $\Sigma(Q)=\left\{\alpha_{4}\right\}$, then $Y$ is isomorphic to $\mathbb{Q}_{5}$ and $\phi: U \rightarrow Y$ is a tower of affine bundles whose direction vector bundles are pull-backs of $E=\left(\mathcal{O}_{\mathbb{Q}_{5}}(1)\right)^{\perp}$ and $E^{\prime}=S$ where $E$ is the restriction of the tautological quotient bundle of $\mathbb{P}^{6}$ to $\mathbb{Q}_{5}$ and $S$ is the spinor bundle on $\mathbb{Q}_{5}$.

Proof. According to the previous Lemma, we only need to identify in each case the direction vector bundles of the affine bundles and to notice (see [Per02] proof of Proposition 5) that the first affine bundle over $Y$ is always a vector bundle.
To identify the vector bundles, we only have to identify the corresponding representations. Indeed, recall from [Per02, Proposition 5] that the direction vector bundles are equivariant and correspond to the $L_{Q^{w_{0}}} \cap P$-representations $U_{Q^{w_{0}}}^{i} / U_{Q^{w_{0}}}^{i-1} \cdot\left(U_{Q^{w_{0}}}^{i} \cap P\right)$. We therefore only have to compute their highest weight which is an easy check using [Bou54, Tables]. Note that the representation corresponding to the sheaf $\left(\mathcal{O}_{\mathbb{Q}_{n}}(1)\right)^{\perp}$ on an $n$-dimensional quadric is not irreducible as a representation of the semisimple part of $L_{Q^{w_{0}}} \cap P$ but is an irreducible non simple representation of $L_{Q^{w_{0}}} \cap P$. Note also that the above description of vector bundles for the adjoint varieties were given in [CP11a].

## 2 Rectriction of some homogeneous vector bundles to curves

In this section we gather some known results and some new ones on the geometry of curves in the projective space and in smooth quadrics. As explained in the previous sections, all the affine bundles $\phi: U \rightarrow Y$ we have to consider are homogeneous vector bundles over these varieties. Therefore the main aim of the section is to control the cohomology of the pull-back to curves of some equivariant vector bundles. Even if we only need these results for elliptic curves, we state them for any curve of genus $g$.

### 2.1 Projective spaces

In this subsection we recall some results on secants to a curve. The following result can be found in [Har77, Proposition IV.3.8 and Theorem IV.3.9].

Proposition 2.1 Let $C$ be a reduced and irreducible curve in $\mathbb{P}^{r}$ such that any secant line to $C$ is a multisecant, then $C$ is a line.

We will use this statement via the following corollary.
Corollary 2.2 Let $C$ be a reduced and irreducible curve in $\mathbb{P}^{r}$ which is not a line, then there exists a point $x$ in $C$ such that the projection from $x$ is birational from $C$ onto its image.

Let $C$ be a smooth curve of genus $g$ and let $f: C \rightarrow \mathbb{P}^{r}$ be a morphism such that $f^{*} \mathcal{O}_{\mathbb{P} r}(1)$ is of degree $d$. We want to prove that the pull back of the homogeneous bundles $\Omega_{\mathbb{P}^{r}}^{k}(k)$ through $f$ admits nice filtrations. The following lemma can be found in [GLP83, Remark (2) page 498].

Lemma 2.3 Assume that $f$ is locally injective and that $f(C)$ is non degenerate i.e. not contained in an hyperplane. Then, for almost all choices of $r-1$ points $\left(x_{i}\right)_{i \in[1, r-1]}$ in $C$, there exists a filtration

$$
0=F^{r+1} \subset F^{r} \subset \cdots \subset F^{1}=f^{*} \Omega_{\mathbb{P}^{r} r}^{1}(1)
$$

such that $F^{i} / F^{i+1}=\mathcal{O}_{C}\left(-x_{i}\right)$ for $i \in[1, r-1]$ and $F^{r} / F^{r+1}=f^{*} \mathcal{O}_{\mathbb{P}^{r}}(-1) \otimes$ $\mathcal{O}_{C}\left(\sum_{i} x_{i}\right)$.

Proof. Let us set $M=f^{*} \Omega_{\mathbb{P}^{r}}^{1}(1)$ and $L=f^{*} \mathcal{O}_{\mathbb{P}^{r}}(1)$. Let us also denote by $V^{\vee}$ the vector space $H^{0}\left(\mathbb{P}^{r}, \mathcal{O}_{\mathbb{P}^{r}}(1)\right)$. Because $f(C)$ is non degenerate, we may consider $V^{\vee}$ as a subspace of $H^{0}(C, L)$. We have an exact sequence $0 \rightarrow M \rightarrow$ $V^{\vee} \otimes \mathcal{O}_{C} \rightarrow L \rightarrow 0$.
We proceed by induction on $r$. Let us choose a point $x_{1}$ on $C$. Let us denote by $W^{\vee}$ the intersection $V^{\vee} \cap H^{0}\left(C, L\left(-x_{1}\right)\right)$ in the vector space $H^{0}(C, L)$. If $f\left(x_{1}\right)$ is smooth, the map $W^{\vee} \otimes \mathcal{O}_{C} \rightarrow L\left(-x_{1}\right)$ is surjective and we have the commutative diagram:

The snake lemma implies that the left most vertical map is surjective and we get the term $F^{2}$ of the filtration by taking the kernel of this map which is also
the kernel of the map $W^{\vee} \otimes \mathcal{O}_{C} \rightarrow L\left(-x_{1}\right)$. Replacing $V$ by $W$ and $L$ by $L\left(-x_{1}\right)$ we get a morphism $f_{2}$ from $C$ to $\mathbb{P}^{r-1}$ and $F^{2}=f_{2}^{*} \Omega_{\mathbb{P}^{r-1}}(1)$. The morphism $f_{2}$ is the composition of $f$ with the projection with center $x_{1}$ and because, in characteristic zero, general secants are not multisecant (see Corollary 2.2), $f_{2}$ is also generically injective for $x_{1}$ general. We may apply then the induction hypothesis. For $r=1$, the result is true.

Remark 2.4 Note that in the above filtration, all the vector bunndles $F^{i}$ are constructed as tautological subbundles, therefore their dual are globally generated.

Corollary 2.5 Assume that $f(C)$ is non degenerate, then for almost all choices of $r-1$ points $\left(x_{i}\right)_{i \in[1, r-1]}$ in $C$, there exists a filtration

$$
0=G^{s+1} \subset G^{s} \subset \cdots \subset G^{1}=f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k)
$$

such that $G^{i} / G^{i+1}=\mathcal{O}_{C}\left(-\left(x_{i_{1}}+\cdots+x_{i_{k}}\right)\right)$ with $\left\{i_{1}, \cdots, i_{k}\right\} \subset[1, r-1]$ or $G^{i} / G^{i+1}=f^{*} \mathcal{O}_{\mathbb{P}^{r}}(-1) \otimes \mathcal{O}_{C}\left(x_{i_{1}}+\cdots+x_{i_{r-k}}\right)$ with $\left\{i_{1}, \cdots, i_{r-k}\right\} \subset[1, r-1]$.

Proof. We simply take the $k$-th exterior product of the previous filtration.

Corollary 2.6 Assume that $f(C)$ is non degenerate. Let $g$ be the genus of $C$ and $d$ the degree of $f^{*} \mathcal{O}_{\mathbb{P}^{r}}(1)$. If $g \leq r-k$, then we have the vanishing $H^{1}\left(C, f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k+1)\right)=0$.

Proof. Indeed, for $g \leq r-k$ and for general points $\left(x_{i}\right)_{i \in[1, r-1]}$ on $C$, we have the vanishing $H^{1}\left(C, \mathcal{O}_{C}\left(x_{i_{1}}+\cdots+x_{i_{r-k}}\right)\right)=0$. Note that because $f(C)$ is non degenerate, we must have the inequality $g \leq d-r \leq d-k$ and this condition implies the following vanishing $H^{1}\left(C, f^{*} \mathcal{O}_{\mathbb{P}^{r}}(1) \otimes \mathcal{O}_{C}\left(-\left(x_{i_{1}}+\cdots+x_{i_{k}}\right)\right)\right)=0$.

Let us assume that $C$ is elliptic. Then even if $f(C)$ is degenerate we may obtain results. Indeed, if $f(C)$ is degenerate, there is a minimal linear space $H$ in $\mathbb{P}^{r}$ of codimension say $a$ containing $f(C)$ and such that $f(C)$ is non degenerate in $H$. Furthermore we have the exact sequence $0 \rightarrow \mathcal{O}_{C}^{a} \rightarrow f^{*} \Omega_{\mathbb{P} r}^{1}(1) \rightarrow f^{*} \Omega_{H}^{1}(1) \rightarrow 0$ from which we deduce a filtration of $f^{*} \Omega_{\mathbb{P}^{r}}^{1}(1)$. In particular we get the following result.

Proposition 2.7 Assume that $C$ is elliptic. If $f(C)$ is non degenerate in a linear subspace of codimension a, then we have the equality $\operatorname{dim} H^{1}\left(C, f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k+\right.$ 1)) $=\binom{a}{r-k}$ (with $\binom{a}{r-k}=0$ if $\left.a<r-k\right)$.

In particular, if we have the inequality $\operatorname{dim} H^{1}\left(C, f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k+1)\right)>0$, then there exists an integer $a \geq r-k$ such that $\operatorname{dim} H^{1}\left(C, f^{*} \Omega_{\mathbb{P} r}^{k}(k+1)\right)=\binom{a}{r-k}$ and $f(C)$ in non degenerate in a linear subspace of codimension a.

Proof. Taking the $k$-th exterior power of the exact sequence $0 \rightarrow \mathcal{O}_{C}^{a} \rightarrow$ $f^{*} \Omega_{\mathbb{P}^{r}}^{1}(1) \rightarrow f^{*} \Omega_{H}^{1}(1) \rightarrow 0$ and tensoring it by $f^{*} \mathcal{O}_{\mathbb{P}^{r}}(1)$, we get a filtration of $f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k+1)$ by the vector bundles $\Lambda^{u}\left(\mathcal{O}_{C}^{a}\right) \otimes f^{*} \Omega_{H}^{v}(v+1)$ for $u+v=k$ and $u, v$ non negative. By Corollary 2.6, the first cohomology groups of these bundles vanish except maybe for $v=0$ or $v=r-a$. For $v=0$ we have $\Lambda^{u}\left(\mathcal{O}_{C}^{a}\right) \otimes f^{*} \Omega_{H}^{v}(v+1)=\Lambda^{k}\left(\mathcal{O}_{C}^{a}\right) \otimes f^{*} \mathcal{O}_{\mathbb{P}^{r}}(1)$ and for $v=r-a$ we have $\Lambda^{u}\left(\mathcal{O}_{C}^{a}\right) \otimes f^{*} \Omega_{H}^{v}(v+1)=\Lambda^{k+a-r}\left(\mathcal{O}_{C}^{a}\right)$. The first cohomology group in the first case vanishes while the first cohomology group in the second case has dimension $\binom{a}{r-k}$. We thus have an inequality $\operatorname{dim} H^{1}\left(C, f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k+1)\right) \leq\binom{ a}{r-k}$.
For $a<r-k$, we are done. If $a \geq r-k$, let us consider the identification $\Omega_{\mathbb{P}^{r}}^{k}(k+1)=\left(\Omega_{\mathbb{P}^{r}}^{r-k}(r-k)\right)^{\vee}$. By the above exact sequence, we have a trivial subbundle of rank $a$ of $f^{*} \Omega_{\mathbb{P} r}^{1}(1)$ therefore we have a trivial subbundle of rank $\binom{a}{r-k}$ in $f^{*} \Omega_{\mathbb{P} r}^{r-k}(r-k)$ (take the $r-k$ exterior power). By duality, there is a trivial quotient bundle of rank $\binom{a}{r-k}$ of $f^{*} \Omega_{\mathbb{P}^{r}}^{k}(k+1)$.
Lemma 2.8 Let $E$ be a globally generated vector bundle on $C$ such that $E$ has a trivial quotient of rank $n$, then $\operatorname{dim} H^{1}(C, E) \geq n$.

Proof. By Serre duality we have an isomorphism $H^{1}(C, E) \simeq H^{0}\left(C, E^{\vee}\right)^{\vee}$. We therefore need to prove that $\operatorname{dim} H^{0}\left(C, E^{\vee}\right) \geq n$. But we have a surjection $E \rightarrow \mathcal{O}_{C}^{n}$ giving rise to an injection $\mathcal{O}_{C}^{n} \rightarrow E^{\vee}$ and the result follows.
We conclude using the previous lemma and because $\Omega_{\mathbb{P}^{r}}^{k}(k+1)$ is globally generated.

### 2.2 Spinor Bundles on Quadrics

In this section we consider the spinor bundles on quadrics and their restriction to elliptic curves.
Proposition 2.9 Let $\mathbb{Q}_{n}$ be a smooth $n$-dimensional quadric and let $E$ be a spinor bundle on $\mathbb{Q}_{n}$. Let $f: C \rightarrow \mathbb{Q}_{n}$ be a morphism from a smooth irreducible curve to $\mathbb{Q}_{n}$. Then the pull-back $f^{*} E$ is isomorphic to a direct sum $\mathcal{O}_{C}{ }^{2^{\beta}} \oplus F$ where $F$ has no trivial factor if and only if $f$ factors through an isotropic subspace of (linear) dimension $[n / 2]+1-\alpha$ with

$$
\alpha= \begin{cases}\beta & \text { for } n \text { odd, } \\ \beta+1 & \text { for } n \text { even and } \beta>0 \\ 0 & \text { for } n \text { even and } \beta=0\end{cases}
$$

and in the last case, the maximal isotropic subspace has to be an element of a fixed component of the two connected components of maximal isotropic subspaces.
Proof. We shall here use the results of G. Ottaviani [Ott88] on the spinor bundles. Let us write $h=\lceil n / 2\rceil-1$ and $p=[n / 2]+1$. There is an embedding $\varphi: \mathbb{Q}_{n} \rightarrow \mathbb{G}\left(2^{h}, 2^{h+1}\right)$ such that $E=\varphi^{*} K$ with $K$ the tautological subbundle in the Grassmann variety $\mathbb{G}\left(2^{h}, 2^{h+1}\right)$ of $2^{h}$ dimensional subspaces in $\mathbb{C}^{2^{h+1}}$.

Lemma 2.10 Let $x$ and $y$ be points on $\mathbb{Q}_{n}$, then we have the equality $\mathbb{C}^{2^{h+1}}=$ $K_{\varphi(x)} \oplus K_{\varphi(y)}$ if and only if $x$ and $y$ are not orthogonal.

Proof. We shall consider the dual assertion: the map $\mathbb{C}^{2^{h+1}} \rightarrow K_{\varphi(x)}^{\vee} \oplus K_{\varphi(y)}^{\vee}$ is an isomorphism if and only if $x$ and $y$ are not orthogonal. To test this assertion, we can restrict the bundle $K$ to some subvariety containing both $x$ and $y$. If $x$ and $y$ are not orthogonal, then we may choose a smooth conic $c: \mathbb{P}^{1} \rightarrow Q_{n} \rightarrow \mathbb{G}\left(2^{h}, 2^{h+1}\right)$ passing through $x$ and $y$. By [Ott88, Theorem 1.4], the pull back $c^{*} K^{\vee}$ is isomorphic to $\mathcal{O}_{\mathbb{P}^{1}}(1)^{2^{h}}$. The surjectivity condition holds.
Conversely, if $x$ and $y$ are orthogonal, then there exists a maximal isotropic subspace $V_{p}$ (if $n$ is even we can choose $V_{p}$ to be in any of the two conneced components of maximal isotropic subspaces) such that $x$ and $y$ are contained in $\mathbb{P}\left(V_{p}\right)$. By [Ott88, Theorems 2.5 and 2.6$]$ the restriction of $K$ to $\mathbb{P}\left(V_{p}\right)$ contains a trivial factor (if $n$ is even this is true only for $V_{p}$ in one of the two connected components). Therefore the surjectivity condition does not hold.

Let us return to the proof of the proposition. Remark that $f^{*} E$ has a trivial factor if and only if for all $x \in C$ the subspaces $K_{\varphi(x)}$ have a common intersection in $\mathbb{C}^{2^{h+1}}$. This occurs only if for all $x$ and $y$ in $C$, the points $f(x)$ and $f(y)$ are orthogonal. In particular the linear subspace spanned by $f(C)$ has to be isotropic. Therefore if the curve $f(C)$ is not contained in an isotropic subspaces then $f^{*} E$ has no trivial factor.
Let us assume that $f^{*} E$ has a trivial factor. Then $f$ factors through an isotropic subspace $V_{p}$. Furthermore by [Ott88, Theorems 2.5 and 2.6], we know that the restriction $E_{\mathbb{P}\left(V_{p}\right)}$ is isomorphic to one of the following direct sums (the first case occurs for $n$ odd while the other two cases occur for $n$ even):

$$
\bigoplus_{k=0}^{p} \Omega_{\mathbb{P}\left(V_{p}\right)}^{k}(k), \quad \bigoplus_{k=0, k \text { odd }}^{p} \Omega_{\mathbb{P}\left(V_{p}\right)}^{k}(k) \quad \text { or } \quad \bigoplus_{k=0, k \text { even }}^{p} \Omega_{\mathbb{P}\left(V_{p}\right)}^{k}(k)
$$

By the previous results on the projective space, we conclude that if $f(C)$ factors through a linear subspace of linear dimension $p-\alpha$ and if there is a unique such factor then $V_{p}$ is in the connected component of $\mathbb{G}_{Q}(p, 2 p)$ corresponding to the last decomposition above. The number of trivial factors in $f^{*} E$ is then $2^{\beta}$ with $\beta$ and $\alpha$ as above.

For elliptic curves, applying the same techniques as in the case of the projective space, we obtain the following result.

Corollary 2.11 Let $\mathbb{Q}_{n}$ be a smooth $n$-dimensional quadric and let $E$ be a spinor bundle on $\mathbb{Q}_{n}$. Let $f: C \rightarrow \mathbb{Q}_{n}$ be a morphism from a smooth irreducible elliptic curve to $\mathbb{Q}_{n}$. Then we have the equality $\operatorname{dim} H^{1}\left(C, f^{*} E\right)=2^{\beta}$ if and only if factors through an isotropic subspace of (linear) dimension $[n / 2]+1-\alpha$
with

$$
\alpha= \begin{cases}\beta & \text { for } n \text { odd } \\ \beta+1 & \text { for } n \text { even and } \beta>0 \\ 0 & \text { for } n \text { even and } \beta=0\end{cases}
$$

and in the last case, the maximal isotropic subspace has to be an element of a fixed component of the two connected components of maximal isotropic subspaces.

## 3 IrReducibility

We are now in position to prove our main result. Let $C$ be a smooth elliptic curve. We proceed via a case-by-case analysis to finish the proof of Theorem 0.1 .

### 3.1 Projective space

Our proof is based on the fact that the irreducibility of the scheme of morphisms to a projective space is well known. Let us first recall this fact. Let $X$ be the projective space $\mathbb{P}(V)$ with $V$ of dimension $n$.

FACT 3.1 Let $d \geq 2$ be an integer, the scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $d n$.

Proof. The scheme of morphisms is described by simple Brill-Noether data: a line bundle $\mathcal{L}$ on $C$ of degree $d$ and a linear map from $V^{\vee}$ to $H^{0}(C, \mathcal{L})$. But for $d$ positive, we have $H^{1}(C, \mathcal{L})=0$ therefore $H^{0}(C, \mathcal{L})$ is of constant dimension $d$ for all $\mathcal{L}$ and the result follows from the fact that $\mathrm{Jac}^{d}(C)$, the Jacobian of degree $d$ line bundles on $C$, is irreducible: the variety $\operatorname{Hom}_{d}(C, \mathbb{P}(V))$ is a locally trivial bundle over $\operatorname{Jac}^{d}(C)$ with fiber $\mathbb{P}\left(V \otimes H^{0}(C, \mathcal{L})\right)$ over $\mathcal{L}$.

### 3.2 Grassmann varieties

We now deal with Grassmann varieties. Note that in this case the result was proved by A. Bruguières [Bru87]. We include here a proof that will serve as a model for the other cases. Let $X$ be the Grassmann variety $\mathbb{G}(p, n)$ of $p$ dimensional vector spaces in a vector space of dimension $n$.

Proposition 3.2 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension nd for $d \geq n$.

Proof. Consider the open subset $U$ given by Theorem 1.6. We have a morphism $\phi: U \rightarrow Y$ with $Y \simeq \mathbb{P}^{n-p}$ which is the vector bundle

$$
E=T_{\mathbb{P}^{n-p}}(-1) \otimes \mathcal{O}_{\mathbb{P}^{n-p}}^{p-1}=\left(\Omega_{\mathbb{P}^{n-p}}^{n-p-1}(n-p)\right)^{p-1}
$$

By Proposition 1.1, we only need to prove the irreducibility of the scheme $\operatorname{Hom}_{d}(C, U)$. For this we study the map $\phi$. Let us denote by $\mathbf{H}_{a}$ the locally
closed subset of $\operatorname{Hom}_{d}(C, Y)$ of maps whose image is contained in a linear subspace of codimension $a$ and not in a smaller linear subspace. The dimension of this locally closed subset is $a(n-p+1-a)+d(n-p+1-a)$. Indeed, there is a morphism $\mathbf{H}_{a} \rightarrow \mathbb{G}(n-p+1-a, n-p+1)$ sending to a morphism the unique linear subspace of codimension $a$ containing its image. The fibers are isomorphic to $\operatorname{Hom}_{d}\left(C, \mathbb{P}^{n-p-a}\right)$.
Now the inverse image under the map $\Phi: \operatorname{Hom}_{d}(C, U) \rightarrow \operatorname{Hom}_{d}(C, Y)$ induced by $\phi$ of $\mathbf{H}_{a}$ is irreducible of dimension $\operatorname{dim} \mathbf{H}_{a}+\operatorname{dim} H^{0}\left(C, f^{*} E\right)$ for $f \in \mathbf{H}_{a}$. By Proposition 2.7 we have $\operatorname{dim} H^{0}\left(C, f^{*} E\right)=(d \operatorname{deg}(E)+a)(p-1)=$ $d(p-1)+a(p-1)$. In particular for $d \geq n$, the dimension of $\Phi^{-1}\left(\mathbf{H}_{a}\right)$ is $(d+a)(n-a)=d n-a(d-n)-a^{2}<d n$ for $a>0$. The locally closed subsets $\Phi^{-1}\left(\mathbf{H}_{a}\right)$ for $a>0$ are therefore of dimension smaller than the dimensions (at least $d n$ ) of irreducible components of $\operatorname{Hom}_{d}(C, U)$ thus the irreducible components of $\mathbf{H o m}_{d}\left(\mathbb{P}^{1}, U\right)$ are those of $\Phi^{-1}\left(\mathbf{H}_{0}\right)$ which is irreducible of dimension $d n$.

Remark 3.3 For smaller degrees, the scheme $\operatorname{Hom}_{d}(C, X)$ is not irreducible (except in degree 2). Its irreducible components were described in [Bru87].

### 3.3 Quadrics

We shall now deal with smooth quadrics. Note that in this case the irreducibility of the scheme of morphisms was proved by E. Ballico [Bal89] for quadrics of dimension $n \geq 6$ for curves of genus $g$ with $g \leq\left\lfloor\frac{n-1}{2}\right\rfloor$ and for the degree $d \geq 2 g-1$. Let $X$ be a smooth quadric of dimension $n$.

Proposition 3.4 Assume that $\operatorname{dim} X \neq 3$, then the scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $n d$ for $d \geq 3$.

Proof. We proceed as for the Grassmann variety and consider the open subset $U$ given by Theorem 1.6. We have a tower of affine bundles $\phi: U \rightarrow Y$ where $Y \simeq \mathbb{P}^{r}$ with $r=\lfloor n / 2\rfloor$ and the direction vector bundles are the pullbacks of $E=\Omega_{\mathbb{P}^{r}}^{1}(2)$ for $n$ even (here $\phi$ is a vector bundle) and to $E=\Omega_{\mathbb{P}^{r}}^{1}(2)$ and $E^{\prime}=\mathcal{O}_{\mathbb{P}^{r}}(1)$ for $n$ odd.
By Proposition 2.7 the vector bundle $E$ satisfies $H^{1}\left(C, f^{*} E\right)=0$ for any map $f: C \rightarrow Y$ of degree $d \geq 3$ as soon as $f$ does not factor through a line. In this latter case we have $\operatorname{dim} H^{1}\left(C, f^{*} E\right)=1$ and we conclude by Proposition 1.3.

Remark 3.5 (1) Note that if $\operatorname{dim} X \leq 2$, then $X$ is a product of projective lines and the result follows from that case. However, if $\operatorname{dim} X=3$, then in the above proof we get $r=1$ and $\Omega_{\mathbb{P}^{r}}^{1}(2)=\mathcal{O}_{\mathbb{P}^{r}}$ and we do not get the vanishing condition.
(11) Note that for $d=2$ the scheme $\operatorname{Hom}_{d}(C, X)$ is also irreducible but not of the expected dimension since any degree 2 morphism factors through a line. The dimension is $2 n+1$.

Even if we cannot prove, with our method, Proposition 3.4 when $X$ is 3dimensional, the result is still true.
Proposition 3.6 Let $X=\mathbb{Q}_{3}$ be a smooth quadric of dimension 3, then the scheme $\mathbf{H o m}_{d}(C, X)$ is irreducible of dimension $3 d$ for $d \geq 3$.

We give a proof of this result for $d \geq 4$ in the appendix, using a different method. The case where $d=3$ is given by the following remark.

REMARK 3.7 Any morphism of degree 2 or 3 from an elliptic curve to $\mathbb{Q}_{3}$ has to factor through a line. This is clear for degree 2, and for degree 3 the morphism factors through a plane. But as $\mathbb{Q}_{3}$ contains no plane, the image is contained in the intersection of $\mathbb{Q}_{3}$ with a plane. It has to be a line for degree reasons. In particular the scheme of morphisms $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $3+2 d$ for $d=2$ or $d=3$.

### 3.4 Maximal orthogonal Grassmann varieties

Let $X$ be a maximal orthogonal Grassmann variety $\mathbb{G}_{Q}(n, 2 n)$. The following result already appeared in the work of the second author [Per12] where it was proved by a different method.

Proposition 3.8 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension 2( $n-$ 1) $d$ for $d \geq n-1$.

Proof. The map $\phi: U \rightarrow Y$ is the vector bundle $E=\Lambda^{2}\left(T_{\mathbb{P}^{n-1}}(-1)\right)=$ $\Omega_{\mathbb{P} n-1}^{n-3}(n-2)$ over $Y \simeq \mathbb{P}^{n-1}$. By Proposition 2.7, the fibers of $\Phi$ : $\operatorname{Hom}_{d}(C, U) \rightarrow \operatorname{Hom}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non-degenerate in a linear subspace of codimension $a$ are of dimension $d(n-2)+\binom{a}{2}$. Therefore we have $\operatorname{dim} p^{-1}\left(\mathbf{H}_{a}\right)=2 d(n-1)+a(n-$ $a)+\binom{a}{2}-a d$. This dimension is strictly smaller than the expected dimension $2 d(n-1)$ for $a>0$ and $d \geq n-1$. The result follows.

Corollary 3.9 For $d \in[2, n]$, the scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension

$$
2(n-1) d+\frac{1}{2}(n-d)(n-d-1)
$$

Proof. Let $f: C \rightarrow X$ be a morphism of degree $d$, then the kernel $\operatorname{ker}(f)$ of $f$ i.e. the intersection of all subspaces $f(x)$ for $x \in C$ is of dimension at least $n-d$ (see [Buc03] for other applications of this definition). Indeed, consider the tautological exact sequence

$$
0 \rightarrow K \rightarrow \mathcal{O}_{X}^{2 n} \rightarrow Q \rightarrow 0
$$

on $X$ where $K$ and $Q$ are the tautological subbundle and quotient bundle. On $X$ we have the identification $Q \simeq K^{\vee}$. Pulling back this sequence to $C$ via $f$ we get an exact sequence on the curve. Taking cohomology we obtain:

$$
0 \rightarrow H^{0}(C, K) \rightarrow \mathbb{C}^{2 n} \rightarrow H^{1}(C, K) \rightarrow H^{1}(C, K) \rightarrow \mathbb{C}^{2 n} \rightarrow H^{0}(C, K) \rightarrow 0
$$

Let us denote by $h^{0}$ and $h^{1}$ the dimensions of $H^{0}(C, K)$ and $H^{1}(C, K)$. Since the map $f$ is of degree $d$ in $X$, the degree of $K$ is $-2 d$ and we have the equality $h^{0}=h^{1}-2 d$. We deduce the inequality $h^{0} \geq n-d$. This implies that $\operatorname{ker}(f)$ is of dimension at least $n-d$. Note also that for a general curve the kernel is of dimension exactly $n-d$.
Let us consider the following incidence variety $I=\left\{\left(f, V_{n-d}\right) \in \operatorname{Hom}_{d}(C, X) \times\right.$ $\mathbb{G}_{Q}(n-d, 2 n) /$ for all $x \in C$ we have $\left.V_{n-d} \subset f(x) \subset V_{n-d}^{\perp}\right\}$. Here $\mathbb{G}_{Q}(n-$ $d, 2 n)$ is the Grassmann variety of isotropic subspaces of $\mathbb{C}^{2 n}$ of dimension $n-d$. The above condition on $f$ simply translates in $V_{n-d} \subset \operatorname{ker}(f)$. Note that the second inclusion is implied by the first one since we have $f(x)=f(x)^{\perp}$. The projection $p: I \rightarrow \operatorname{Hom}_{d}(C, X)$ is surjective and birational (because for a general curve the kernel is of dimension $n-d$ ) while the $\operatorname{map} q: I \rightarrow \mathbb{G}_{Q}(n-d, 2 n)$ is an equivariant locally trivial fibration with fibers $\operatorname{Hom}_{d}(C, Y)$ with $Y \simeq \mathbb{G}_{Q}(d, 2 d)$. By the previous proposition these fibers are irreducible of dimension $2 d(d-1)$. The result follows.

### 3.5 Adjoint varieties of type $B$ and $D$

Let us consider the variety $X=\mathbb{G}_{Q}(2, n)$ of isotropic planes in a vector space of dimension $n$ endowed with a non-degenerate bilinear form.

Proposition 3.10 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $(n-$ 3) $d$ for $d \geq n-1$.

Proof. The map $\phi: U \rightarrow Y$ is the vector bundle $E=\left(\mathcal{O}_{\mathbb{Q}_{n-4}}(1)\right)^{\perp}$ over $Y \simeq \mathbb{Q}_{n-4}$, where $\mathcal{O}_{\mathbb{Q}_{n-4}}(-1)$ is the tautological subbundle on $\mathbb{Q}_{n-4}$.
Here we have to compute the dimension of the scheme of morphisms from an elliptic curve to a cone (the intersection of $\mathbb{Q}_{n-4}$ with a linear subspace of $\mathbb{P}^{n-3}$ in our case). Let $\mathfrak{C}$ be a cone in $\mathbb{P}^{k+r-1}$ associated to a quadratic form of rank $r$ (and therefore with kernel $K$ of dimension $k$ ).

Lemma 3.11 Consider the open subset in the scheme of degree d morphisms from an elliptic curve $C$ to $\mathfrak{C}$ consisting of morphisms whose image is nondegenerate. Then this open subset is of dimension at most $d(k+r-2)$.

Remark that, if $k=0$, the cone $\mathfrak{C}$ is a smooth quadric of dimension $(k+r-2)$ and we already know the result with equality.

Proof. Consider the incidence variety $I=\left\{\left(V_{1}, V_{k+1}\right) \in \mathfrak{C} \times \mathbb{G}_{Q}(k+1, k+\right.$ $\left.r) / V_{1} \subset V_{k+1} \supset K\right\}$. There is a diagram

The map $q$ is simply the blow-up of the vertex of the cone. If $f: C \rightarrow \mathfrak{C}$ has a non degenerate image then its image is not contained in the vertex $\mathbb{P}(K)$ of the cone and we may consider the composition of $f$ with the projection from $K$. This defines a morphism $f^{\prime}: C \rightarrow \mathbb{Q}_{r-2}$ which can be obtained by lifting $f$ to $f_{I}: C \rightarrow I$ and composing with $p$. The degree of this morphism is $d-x$ where $x$ is the multiplicity of the intersection of $f(C)$ with the vertex of the cone.
To compute the dimension of our open set, we consider the map defined by $f \mapsto f^{\prime}$. Its image is contained in $\operatorname{Hom}_{d-x}\left(C, \mathbb{Q}_{r-2}\right)$ which is of dimension $(d-x)(r-2)$. The fiber is given by the morphisms $\mathcal{L} \rightarrow f^{\prime *} V_{k+1}$ where $\mathcal{L}$ is of degree $d$ and $V_{k+1}$ is the tautological subbundle in $\mathbb{Q}_{r-2} \simeq\left\{V_{k+1} \in\right.$ $\left.\mathbb{G}_{Q}(k+1, k+r) / K \subset V_{k+1}\right\}$. Because the projection by $K$ gives a curve of degree $d-x>0$ we have an extension $0 \rightarrow K \otimes \mathcal{O}_{C} \rightarrow f^{\prime *} V_{k+1} \rightarrow \mathcal{L}^{\prime} \rightarrow 0$ with $\mathcal{L}^{\prime}$ of degree $d-x$. This extension has to split, thus the fibers of the map are given by $\left.\mathbb{P} \operatorname{Hom}\left(\mathcal{L}, K \otimes \mathcal{O}_{C} \oplus \mathcal{L}^{\prime}\right)\right)$ which is of dimension $k d+x$. The dimension is therefore at most $d(k+r-2)-x(r-3)$ proving the result for $r \geq 3$. But if $r \leq 2$, then the cone is a union of hyperplanes, thus the curve is degenerate.

By Proposition 2.7, since $E$ is the restriction to $\mathbb{Q}_{n-4}$ of $\Omega_{\mathbb{P}^{n-3}}^{n-4}(n-3)$, the fibers of $\Phi: \operatorname{Hom}_{d}(C, U) \rightarrow \mathbf{H o m}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non-degenerate in a linear subspace of codimension $a$ are of dimension $d+a$. Therefore the dimension of $\Phi^{-1}\left(\mathbf{H}_{a}\right)$ is at most the sum of $d+a$, the dimension of the Grassmann variety $\mathbb{G}(n-2-a, n-2)$ and the dimension of the scheme of degree $d$ morphisms from an elliptic curve $C$ to a cone $\mathfrak{C}$ in $\mathbb{P}^{n-3-a}$, so that $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right) \leq d(n-a-3)+a(n-2-a)+a$. This dimension is strictly smaller than the expected dimension $(n-4) d$ for $a>0$ and $d \geq n-1$. The result follows.

Remark 3.12 The above argument shows that for $d=n-2$, the scheme of morphisms has 2 irreducible components of the expected dimension.

### 3.6 Type $E_{6}$

### 3.6.1 Cayley plane

Let $X$ be isomorphic to $E_{6} / P_{1}$.
Proposition 3.13 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $12 d$ for $d \geq 3$.

Proof. The map $\phi: U \rightarrow Y$ is one of the two spinor bundles $S$ over $Y \simeq \mathbb{Q}_{8}$. By Corollary 2.11, the fibers of $p: \operatorname{Hom}_{d}(C, U) \rightarrow \operatorname{Hom}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non degenerate in an isotropic linear subspace of codimension $a$ are of dimension $4 d+2^{\max (0, a-6)}$ with $a \geq 5$. Therefore we have the equality $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right)=12 d+a(10-a)-\frac{(10-a)(11-\bar{a})}{2}+$ $2^{\max (0, a-6)}-a d$. This dimension is strictly smaller than the expected dimension $12 d$ for $a>0$ and $d \geq 3$. The result follows.

### 3.6.2 AdJOINT VARIETY

Let $X$ be isomorphic to $E_{6} / P_{2}$.
Proposition 3.14 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $11 d$ for $d \geq 9$.

Proof. The map $\phi: U \rightarrow Y$ is a tower of affine bundles over $Y \simeq \mathbb{Q}_{6}$ with direction vector bundles $E=\left(\mathcal{O}_{\mathbb{Q}_{6}}(1)\right)^{\perp}$ (where $\mathcal{O}_{\mathbb{Q}_{6}}(-1)$ is the tautological subbundle on $\mathbb{Q}_{6}$ ) and $E^{\prime}=S \oplus S^{\prime}$ where $S$ and $S^{\prime}$ are the two spinor bundles on $\mathbb{Q}_{6}$. Note that the bundle $E$ is the restriction of the tautological quotient bundle of $\mathbb{P}^{7}$ to $\mathbb{Q}_{6}$. By Proposition 2.7 and Corollary 2.11 , the fibers of $\Phi: \mathbf{H o m}_{d}(C, U) \rightarrow \mathbf{H o m}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non degenerate in a linear subspace of codimension $a$ are of dimension at most $5 d+a$ for $a \leq 3$ or $a \geq 4$ and the subspace containing the curve is non isotropic and $5 d+a+2^{\max (0, a-4)}$ for $a \geq 4$ and the subspace containing the curve is isotropic. Therefore we have the equality $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right)=$ $d(11-a)+a(8-a)+a$ for $a \leq 3$ or $a \geq 4$ and the subspace containing the curve is non isotropic and $d(13-a)+a(8-a)-\frac{(8-a)(9-a)}{2}+a+2^{\max (0, a-4)}$ for $a \geq 4$ and the subspace containing the curve is isotropic. This dimension is strictly smaller than the expected dimension $11 d$ for $a>0$ and $d \geq 9$. The result follows.

### 3.7 Type $E_{7}$

### 3.7.1 Freudenthal variety

Let $X$ be isomorphic to $E_{7} / P_{7}$.
Proposition 3.15 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $18 d$ for $d \geq 8$.

Proof. The map $\phi: U \rightarrow Y$ is a tower of affine bundles with directon vector bundles $E=\Omega_{\mathbb{P}^{6}}^{5}(6)$ and $E^{\prime}=\Omega_{\mathbb{P}^{6}}^{2}(3)$. By Proposition 2.7, the fibers of $\Phi$ : $\operatorname{Hom}_{d}(C, U) \rightarrow \operatorname{Hom}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non degenerate in a linear subspace of codimension $a$ are of dimension at most $11 d+a+\binom{a}{4}$. Therefore we have $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right)=18 d+$ $a(7-a)+a+\binom{a}{4}-a d$. This dimension is strictly smaller than the expected dimension $18 d$ for $a>0$ and $d \geq 8$. The result follows.

### 3.7.2 AdJoint variety

Let $X$ be isomorphic to $E_{7} / P_{1}$.
Proposition 3.16 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $17 d$ for $d \geq 11$.

Proof. The map $\phi: U \rightarrow Y$ is a tower of affine bundles over $Y \simeq \mathbb{Q}_{8}$ with direction vector bundles $E=\left(\mathcal{O}_{\mathbb{Q}_{8}}(1)\right)^{\perp}$ where $\mathcal{O}_{\mathbb{Q}_{8}}(-1)$ is the tautological subbundle on $\mathbb{Q}_{8}$ and $E^{\prime}=S^{2}$ where $S$ is one of the two spinor bundles on $\mathbb{Q}_{8}$. By Proposition 2.7 and Corollary 2.11, the fibers of $\Phi: \operatorname{Hom}_{d}(C, U) \rightarrow$ $\operatorname{Hom}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non degenerate in a linear subspace of codimension $a$ are of dimension at most $9 d+a$ for $a \leq 4$ or $a \geq 5$ and the subspace containing the curve is non isotropic and $9 d+a+2^{\max (0, a-6)}$ for $a \geq 5$ and the subspace containing the curve is isotropic. Therefore we have the equality $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right)=d(17-a)+a(10-a)+a$ for $a \leq 4$ or $a \geq 5$ and the subspace containing the curve is non isotropic and $d(19-a)+a(10-a)-\frac{(10-a)(11-a)}{2}+a+2^{\max (0, a-6)}$ for $a \geq 5$ and the subspace containing the curve is isotropic. This dimension is strictly smaller than the expected dimension $17 d$ for $a>0$ and $d \geq 11$. The result follows.

### 3.8 Adjoint variety of type $E_{8}$

Let $X$ be isomorphic to $E_{8} / P_{8}$.
Proposition 3.17 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $29 d$ for $d \geq 15$.

Proof. The $\operatorname{map} \phi: U \rightarrow Y$ is a tower of affine bundles over $Y \simeq \mathbb{Q}_{12}$ with direction vctor bundles $E=\left(\mathcal{O}_{\mathbb{Q}_{12}}(1)\right)^{\perp}$ where $\mathcal{O}_{\mathbb{Q}_{12}}(-1)$ is the tautological subbundle on $\mathbb{Q}_{12}$ and $E^{\prime}=S$ where $S$ is one of the two spinor bundles on $\mathbb{Q}_{12}$. By Proposition 2.7 and Corollary 2.11, the fibers of $\Phi: \operatorname{Hom}_{d}(C, U) \rightarrow$ $\operatorname{Hom}_{d}(C, Y)$ over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non degenerate in a linear subspace of codimension $a$ are of dimension at most $17 d+a$ for $a \leq 6$ or $a \geq 7$ and the subspace containing the curve is non isotropic and $17 d+a+2^{\max (0, a-8)}$ for $a \geq 7$ and the subspace containing the curve is isotropic. Therefore we have the equality $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right)=d(29-a)+a(14-a)+a$ for $a \leq 6$ or $a \geq 7$ and the subspace containing the curve is non isotropic and $d(31-a)+a(14-a)-\frac{(14-a)(15-a)}{2}+a+2^{\max (0, a-8)}$ for $a \geq 7$ and the subspace containing the curve is isotropic. This dimension is strictly smaller than the expected dimension $29 d$ for $a>0$ and $d \geq 15$. The result follows.

### 3.9 Adjoint variety of type $F_{4}$

Let $X$ be isomorphic to $F_{4} / P_{1}$.
Proposition 3.18 The scheme $\operatorname{Hom}_{d}(C, X)$ is irreducible of dimension $11 d$ for $d \geq 8$.

Proof. The map $\phi: U \rightarrow Y$ is a tower of affine bundles over $Y \simeq \mathbb{Q}_{5}$ with direction vctor bundles $E=\left(\mathcal{O}_{\mathbb{Q}_{5}}(1)\right)^{\perp}$ where $\mathcal{O}_{\mathbb{Q}_{5}}(-1)$ is the tautological subbundle on $\mathbb{Q}_{5}$ and $E^{\prime}=S$ where $S$ is the spinor bundle on $\mathbb{Q}_{5}$. By Proposition 2.7 and Corollary 2.11, the fibers of $\Phi: \operatorname{Hom}_{d}(C, U) \rightarrow \mathbf{H o m}_{d}(C, Y)$
over the locally closed subset $\mathbf{H}_{a}$ of morphisms whose image is non degenerate in a linear subspace of codimension $a$ are of dimension at most $6 d+a$ for $a \leq 3$ or $a \geq 4$ and the subspace containing the curve is non isotropic and $6 d+a+2^{\max (0, a-5)}$ for $a \geq 4$ and the subspace containing the curve is isotropic. Therefore we have the equality $\operatorname{dim} \Phi^{-1}\left(\mathbf{H}_{a}\right)=d(11-a)+a(7-a)+a$ for $a \leq 3$ or $a \geq 4$ and the subspace containing the curve is non isotropic and $d(13-a)+a(7-a)-\frac{(7-a)(8-a)}{2}+a+2^{\max (0, a-5)}$ for $a \geq 4$ and the subspace containing the curve is isotropic. This dimension is strictly smaller than the expected dimension $11 d$ for $a>0$ and $d \geq 8$. The result follows.

Remark 3.19 Note that, in Propositions 3.14, 3.15, 3.16, 3.17 and 3.18, it is possible that one can improve the bound on the dimension of $\Phi^{-1}\left(\mathbf{H}_{a}\right)$. Indeed if the affine bundle restricted to a curve in $\mathbf{H}_{a}$ is not a vector bundle then this bound will be strictly smaller. We therefore expect a better bound $d(X)$ in these situations.

## 4 Stable maps

Let us consider the moduli space $\overline{\mathrm{M}}_{1, d}(X)$ of stable maps with source an elliptic curve. Recall the following general result obtained in [KP01].

ThEOREM 4.1 ([KP01]) The moduli space $\overline{\mathrm{M}}_{1, d}(X)$ is connected for any rational homogeneous space $X$ and any degree $d$.

Note, in contrast, that for any $X$ in the tables of the introduction, we have the proposition.

Proposition 4.2 For $d \geq d(X)$, the moduli space $\overline{\mathrm{M}}_{1, d}(X)$ is never irreducible.

Proof. Indeed, consider the locally closed subset of $\bar{M}_{1, d}(X)$ where the degree on the unique elliptic irreducible component of the source of the map is 2 . The dimension of this locally closed subset is $d c_{1}(X)+\operatorname{dim} X$ which is always strictly bigger than the expected dimension $d c_{1}(X)$ which is the dimension of the component containing irreducible curves for $d \geq d(X)$.

However, there is a natural decomposition of this space into locally closed subsets $\mathrm{M}_{1, d_{\tau}}^{\tau}(X)$ parametrised by their combinatorial graph $\tau$ and combinatorial degree $d_{\tau}$ (see [KM94] or also [KP01]). Note that for stable maps of genus one, at most one irreducible component of the source map is an elliptic curve. We call this component (if it exists) the elliptic component of $\tau$. As a consequence of our results we obtain the following proposition.

Proposition 4.3 If the degree $d_{\tau}$ is bigger that $d(X)$ on the elliptic component of $\tau$, then $\mathrm{M}_{1, d_{\tau}}^{\tau}(X)$ is irreducible.

Proof. If there is no elliptic component, then the result follows from the fact (see [BCMP10]) that the moduli space of stable maps of genus 0 passing through at most 2 fixed points is irreducible for any homogeneous space $X$.
If there is an elliptic component, then we claim that the natural forgetful map to the moduli space of elliptic curves is flat with irreducible fibers. Indeed, the fiber over $C$ is isomorphic to the product of $\operatorname{Hom}_{d}(C, X)$ with some moduli spaces of rational stable maps passing through at most 2 fixed points. These last moduli spaces are irreducible of the expected dimension by [BCMP10, Corollary 3.3]. Now by dimension count, any irreducible component of $\mathrm{M}_{d_{\tau}}^{\tau}(X)$ has to dominate the moduli space of elliptic curves (the fibers have constant dimension 1 less than the expected dimension) thus the map is flat. The result follows by [Gro65, Corollaire 2.3.5.(11)].

## A The quadric of dimension 3

In this section, we prove Proposition 3.6 for $d \geq 4$ using Bott-Samelson resolutions (the reader could see [Dem74] for more details on Bott-Samelson resolutions). This method was already used by the second author in [Per12] to study elliptic curves in spinorial varieties.
First we introduce some notation. Let $V$ be a 5 -dimensional vector space endowed with a non degenerate quadratic form $Q$. Then $X$ is the subvariety of $\mathbb{P}(V)$ consisting of isotropic lines in $V$.
For any isotropic flag $W_{\bullet}=\left(W_{1}, W_{2}\right)$ of $V$, we define a Bott-Sameslon resolution $\pi: \widetilde{X} \rightarrow X$ by
$\widetilde{X}=\widetilde{X}_{W_{\bullet}}=\left\{\left(V_{1}^{\prime}, V_{2}, V_{1}\right) \in \mathbb{Q}_{3} \times \mathbb{G}_{Q}(2,5) \times \mathbb{Q}_{3} \mid V_{1}^{\prime} \subset W_{2}, V_{1}^{\prime} \subset V_{2}, V_{1} \subset V_{2}\right\}$, and $\pi\left(V_{1}^{\prime}, V_{2}, V_{1}\right)=V_{1}$. The map $\pi$ is birational, in particular it is an isomorphism over the open $B$-orbit of $X$, where $B$ is the Borel subgroup of $\mathrm{SO}(5)$ associated to $W_{\bullet}$. Moreover if we define $X_{0}=\{\mathrm{pt}\}, X_{1}=\left\{V_{1}^{\prime} \in \mathbb{Q}_{3} \mid V_{1}^{\prime} \subset W_{2}\right\}$ $X_{2}=\left\{\left(V_{1}^{\prime}, V_{2}\right) \in \mathbb{Q}_{3} \times \mathbb{G}_{Q}(2,5) \quad \mid \quad V_{2} \supset V_{1}^{\prime} \subset W_{2}\right\}$ and $X_{3}=\widetilde{X}$, there is sequence of $\mathbb{P}^{1}$-bundles

$$
\widetilde{X}=X_{3} \rightarrow X_{2} \rightarrow X_{1} \rightarrow X_{0}=\{\mathrm{pt}\} .
$$

The proof of Proposition 3.6 uses the 3 following facts.
Fact 1 Under some conditions $(*)_{d}$ on the class $\tilde{\alpha}$ of 1-cycles in $\widetilde{X}$ (see Definition A.4), the scheme $\operatorname{Hom}_{\tilde{\alpha}}(C, \widetilde{X})$ of morphisms from $C$ to $\widetilde{X}$ of class $\tilde{\alpha}$ is irreducible of dimension at most $3 d-1$ with equality for a unique class $\tilde{\alpha}$ ).

Fact 2 For all $f \in \operatorname{Hom}_{d}(C, X)$ such that $f(C)$ is not contained in an isotropic projective line of $\mathbb{P}(V)$, we can choose a flag $W_{\bullet}$ such that $f$ lifts into a unique $\tilde{f}: C \rightarrow \widetilde{X}_{W_{\bullet}}$, such that $\tilde{\alpha}:=\left[\tilde{f}_{*}(C)\right]$ satisfies the conditions $(*)_{d}$. And, for each such $f$, the set of flags that we can choose is a subvariety (not closed) of $\mathrm{SO}(5) / B$ of dimension 3 .

Fact 3 For $d \geq 4$ we prove that the scheme of morphisms from $C$ to $X$ of degree $d$ such that $f(C)$ is contained in an isotropic projective line of $\mathbb{P}(V)$ cannot be an irreducible component of $\operatorname{Hom}_{d}(C, X)$.

Assuming these facts for the moment, let us prove Proposition 3.6. Let $I$ be the set of couples $\left(W_{\bullet}, \tilde{f}\right) \in \mathrm{SO}(5) / B \times \operatorname{Hom}_{(*)_{d}}\left(C, \widetilde{X}_{W_{\bullet}}\right)$ where $\operatorname{Hom}_{(*)_{d}}\left(C, \widetilde{X}_{W_{\bullet}}\right)$ is the scheme of morphisms $\tilde{f}$ from $C$ to $\widetilde{X}_{W_{\bullet}}$ such that $\left[\tilde{f}_{*}(C)\right]$ satisfies $(*)_{d}$. Call $p$ and $q$ the natural projections from $I$ to $\operatorname{Hom}_{d}(C, X)$ and to $\operatorname{SO}(5) / B$ respectively. Then, by the second and third facts, $p$ is dominant as soon as $d \geq 4$ and general fibers of $p$ have dimension 3 . Now, for any flag $W_{\bullet}$, the fiber $q^{-1}\left(W_{\bullet}\right)$ is the disjoint union, over the $\tilde{\alpha}$ satisfying conditions $(*)_{d}$, of the schemes $\operatorname{Hom}_{\tilde{\alpha}}\left(C, \widetilde{X}_{W_{\mathbf{\bullet}}}\right)$ of morphisms $\tilde{f}$ from $C$ to $\widetilde{X}_{W_{\mathbf{\bullet}}}$ such that $\left[\tilde{f}_{*}(C)\right]=\tilde{\alpha}$. By the first fact, exactly one of these latter schemes has maximal dimension $3 d-1$ and moreover this scheme is irreducible, so that the fiber $q^{-1}\left(W_{\bullet}\right)$ is irreducible. Thus $I$ is a union of irreducible connected components of dimension at most $3 d-1+=3 d+3$ with equality for a unique component. The images in $\operatorname{Hom}_{d}(C, X)$ of these components are irreducible of dimension at most $3 d+3-3=3 d$ which is the expected dimension. Therefore all these images are contained in the closure of the image of the maximal one proving the irreducibility. Moreover the dimension of $\operatorname{Hom}_{d}(C, X)$ is therefore $4+(3 d-1)-3=3 d$.

Let us prove the three facts one by one. We begin with a general lemma.
Lemma A. 1 Let $\phi: X \rightarrow Y$ be a $\mathbb{P}^{1}$-fibration with a section $\sigma$. Let $\tilde{\alpha}$ be a class of 1-cycles in $X$. Denote by $T_{\phi}$ the relative tangent bundle and by $\xi$ the divisor $\sigma(Y)$. Suppose that $\tilde{\alpha} \cdot \xi \geq 0$ and that $\tilde{\alpha} \cdot\left(T_{\phi}-\xi\right)>0$.
Then, if $\operatorname{Hom}_{\phi_{*} \tilde{\alpha}}(C, Y)$ is irreducible, $\operatorname{Hom}_{\tilde{\alpha}}(C, X)$ is also irreducible, and

$$
\operatorname{dim}\left(\operatorname{Hom}_{\tilde{\alpha}}(C, X)\right)=\operatorname{dim}\left(\operatorname{Hom}_{\phi_{*} \tilde{\alpha}}(C, Y)\right)+\tilde{\alpha} \cdot T_{\phi}
$$

Proof. Let $E$ be a rank two vector bundle on $Y$ such that $X=\mathbb{P}_{Y}(E)$. The section $\sigma$ is given by a surjection $E \rightarrow L$ where $L$ is an invertible sheaf on $Y$. Let $N$ be the kernel of this map.
We first study the fiber of the map $\operatorname{Hom}_{\widetilde{\alpha}}(C, X) \rightarrow \operatorname{Hom}_{\phi_{*} \widetilde{\alpha}}(C, Y)$ given by composition of morphisms over a morphism $f: C \rightarrow Y$. An element in this fiber is given by a lift of $f$ i.e. a surjective map $f^{*} E \rightarrow M$ of vector bundles on $C$ where $M$ is an invertible sheaf with $2 \operatorname{deg}(M)-\operatorname{deg}\left(f^{*} E\right)=\widetilde{\alpha} \cdot T_{\phi}$. An element in the fiber is therefore given by an invertible sheaf $M$ on $C$ with degree $d=\frac{1}{2}\left(\operatorname{deg}\left(f^{*} E\right)+\widetilde{\alpha} \cdot T_{\phi}\right)$ and a surjective map in $\mathbb{P}\left(\operatorname{Hom}\left(f^{*} E, M\right)\right)$.
Note that we have the equalities $\widetilde{\alpha} \cdot \xi=\operatorname{deg}(M)-\operatorname{deg}\left(f^{*} N\right)$ and $\widetilde{\alpha} \cdot\left(T_{\phi}-\xi\right)=$ $\operatorname{deg}(M)-\operatorname{deg}\left(f^{*} L\right)$. We discuss two cases.
If $\widetilde{\alpha} \cdot \xi>0$ then $\operatorname{Hom}\left(f^{*} E, M\right)$ is isomorphic to $\operatorname{Hom}\left(f^{*} N, M\right) \oplus \operatorname{Hom}\left(f^{*} L, M\right)$ and its dimension $\widetilde{\alpha} \cdot T_{\phi}$ does not depend on $f$. For any invertible sheaf $M$, there exist surjections $f^{*} E \rightarrow M$ and they form an open subset of $\mathbb{P H o m}\left(f^{*} E, M\right) \times$ $\mathrm{Pic}_{d}(C)$. Doing this construction in family as in [Per02, Proposition 4] we get
a smooth fibration or relative dimension $\widetilde{\alpha} \cdot T_{\phi}$ over $\operatorname{Hom}_{\phi_{*}} \widetilde{\alpha}(C, Y)$ and the result follows.
If $\widetilde{\alpha} \cdot \xi=0$, then if $M \nsucceq f^{*} N$ we have $\operatorname{Hom}\left(f^{*} N, M\right)=0$ and any map $f^{*} E \rightarrow M$ factors through $f^{*} L$ and is never surjective because $\operatorname{deg}(M)-$ $\operatorname{deg}\left(f^{*} L\right)=\widetilde{\alpha} \cdot\left(T_{\phi}-\xi\right)>0$. Therefore any pair ( $M, p: f^{*} E \rightarrow M$ ) of the fiber satisfies $M \simeq f^{*} N$. In that case, because of the equality $\operatorname{deg}(M)-\operatorname{deg}\left(f^{*} L\right)=$ $\widetilde{\alpha} \cdot\left(T_{\phi}-\xi\right)>0$, the sheaf $f^{*} E$ is isomorphic to $M \oplus f^{*} L$ and we have an isomorphism $\operatorname{Hom}\left(f^{*} E, M\right) \simeq \operatorname{Hom}\left(f^{*} N, M\right) \oplus \operatorname{Hom}\left(f^{*} L, M\right)$. The dimension of $\operatorname{Hom}\left(f^{*} E, M\right)$ is $\widetilde{\alpha} \cdot T_{\phi}+1$ and does not depend on $f$. The fiber is therefore a non empty open subset of $\mathbb{P} \operatorname{Hom}\left(f^{*} E, M\right)$. We therefore again get a smooth fibration of relative dimension $\widetilde{\alpha} \cdot T_{\phi}$ over $\operatorname{Hom}_{\phi_{*} \widetilde{\alpha}}(C, Y)$.
Applying this lemma to the $\mathbb{P}^{1}$-fibrations $\phi_{i}: X_{i} \rightarrow X_{i-1}$ for $i \in\{1,2,3\}$ given above by a Bott-Samelson resolution $\widetilde{X}$ of $\mathbb{Q}_{3}$, we obtain the following corollary. We denote by $T_{i}$ the relative tangent space of $\phi_{i}$, we define three divisors $\xi_{1}$, $\xi_{2}, \xi_{3}$ of $\widetilde{X}$, which are given by natural sections of the $\phi_{i}$, by

$$
\begin{aligned}
& \xi_{1}=\left\{\left(V_{1}^{\prime}, V_{2}, V_{1}\right) \in \widetilde{X} \quad \left\lvert\, \begin{array}{l}
\left.V_{1}^{\prime}=W_{1}\right\} \\
\xi_{2}=\left\{\left(V_{1}^{\prime}, V_{2}, V_{1}\right) \in \widetilde{X} \mid V_{2}=W_{2}\right\} \\
\xi_{3}=\left\{\left(V_{1}^{\prime}, V_{2}, V_{1}\right) \in \widetilde{X} \mid\right. \\
\left.V_{1}=V_{1}^{\prime}\right\} .
\end{array} .\right.\right.
\end{aligned}
$$

We will again denote by $T_{i}$ the pull-back of $T_{i}$ under the morphisms $\phi_{j}$ for $j>i$.

Corollary A. 2 Let $\tilde{\alpha}$ be a class of 1 -cycles in $\tilde{X}$ satisfying for all $i \in$ $\{1,2,3\}, \tilde{\alpha} \cdot \xi_{i} \geq 0$ and $\tilde{\alpha} \cdot\left(T_{i}-\xi_{i}\right)>0$.
Then $\operatorname{Hom}_{\tilde{\alpha}}(C, \tilde{X})$ is irreducible of dimension $\tilde{\alpha} \cdot\left(T_{1}+T_{2}+T_{3}\right)$.
To obtain the first fact, we use the following result that can be deduced from [Per05, Corollary 3.8 and Fact 3.7] by a short computation.

Proposition A. 3 (乞) The relative tangent bundles $T_{i}$ are expressed in terms of the $\xi_{i}$ as follows:

$$
T_{1}=2 \xi_{1}, \quad T_{2}=2 \xi_{2}+\xi_{1} \text { and } T_{3}=2 \xi_{3}+2 \xi_{2}
$$

In particular, we have $\tilde{\alpha} \cdot \xi_{i} \geq 0$ and $\tilde{\alpha} \cdot\left(T_{i}-\xi_{i}\right)>0$ for all $i \in\{1,2,3\}$ as soon as $\tilde{\alpha} \cdot \xi_{1}>0, \tilde{\alpha} \cdot \xi_{2}>0$ and $\tilde{\alpha} \cdot \xi_{3} \geq 0$, or, $\tilde{\alpha} \cdot \xi_{1}>0, \tilde{\alpha} \cdot \xi_{2} \geq 0$ and $\tilde{\alpha} \cdot \xi_{3}>0$ (u) The pull-back $\pi^{*} \mathcal{O}_{\mathbb{Q}_{3}}(1)$ of the ample generator of the Picard group of $\mathbb{Q}_{3}$ equals $\xi_{1}+2 \xi_{2}+\xi_{3}$. In particular, if $\tilde{\alpha}=\pi^{*}(\alpha)$ where $\alpha$ is the class of 1 -cycles of degree d in $\mathbb{Q}_{3}$, we have $d=\tilde{\alpha} \cdot\left(\xi_{1}+2 \xi_{2}+\xi_{3}\right)$.

Definition A. 4 We say that $\tilde{\alpha}$ satisfies conditions $(*)_{d}$ if

- $\tilde{\alpha} \cdot \xi_{1}>0, \tilde{\alpha} \cdot \xi_{2}>0$ and $\tilde{\alpha} \cdot \xi_{3} \geq 0$, or $\tilde{\alpha} \cdot \xi_{1}>0, \tilde{\alpha} \cdot \xi_{2} \geq 0$ and $\tilde{\alpha} \cdot \xi_{3}>0 ;$
- $d=\tilde{\alpha} \cdot\left(\xi_{1}+2 \xi_{2}+\xi_{3}\right)$.

Remark that, under conditions $(*)_{d}$, we have $\tilde{\alpha} \cdot\left(T_{1}+T_{2}+T_{3}\right)=3 d-\tilde{\alpha} \cdot\left(2 \xi_{2}+\xi_{3}\right)$ and then the dimension of the scheme $\operatorname{Hom}_{\tilde{\alpha}}(C, \tilde{X})$ is at most $3 d-1$ with equality if an only if $\tilde{\alpha} \cdot \xi_{1}=d-1, \tilde{\alpha} \cdot \xi_{2}=0$ and $\tilde{\alpha} \cdot \xi_{3}=1$. We deduce the first fact from above results.

To prove the second fact, fix a curve $f \in \operatorname{Hom}_{d}\left(C, \mathbb{Q}_{3}\right)$ such that $f(C)$ is not contained in an isotropic projective line of $\mathbb{P}(V)$. We begin by proving the following lemma. If $E$ is a vector subspace of $V$, we denote by $E^{\perp}$ the orthogonal subspace to $E$ in $V$ (with respect to $Q$ ). For any point $x$ in $\mathbb{P}(V)$, we denote by $\bar{x}$ the corresponding line in $V$.

Lemma A. 5 There exist 3 points $x_{0}, x_{1}, x_{2}$ of $f(C)$ and an isotropic flag $W_{\bullet}=\left(W_{1}, W_{2}\right)$ such that $\overline{x_{0}}$ is not contained in $W_{1}^{\perp}, \overline{x_{1}}$ is contained in $W_{1}^{\perp}$ but not in $W_{2}$, and $\overline{x_{2}}$ is contained in $W_{2}$.

Proof. First remark that, because $f(C) \subset \mathbb{Q}_{3}$, the condition saying that $f(C)$ is not contained in an isotropic projective line of $\mathbb{P}(V)$ means that $f(C)$ is not contained in a projective line of $\mathbb{P}(V)$.
Then there exist 3 non-collinear points $x_{0}, x_{1}, x_{2}$ in $f(C)$. Let $E:=\overline{x_{0}} \oplus \overline{x_{1}} \oplus \overline{x_{2}}$ and $F:=\overline{x_{1}} \oplus \overline{x_{2}}$. We can assume that $\left.Q\right|_{F}$ is non degenerate, in particular $V=F \oplus F^{\perp}$ and $Q$ is non-degenerate on $F^{\perp}$. Then there exists an isotropic

It is obvious that $\overline{x_{2}}$ is contained in $W_{2}$. And we can also easily check that $\overline{x_{0}}$ is not contained in $W_{1}^{\perp}$ and that $\overline{x_{1}}$ is contained in $W_{1}^{\perp}$ but not in $W_{2}$.

Corollary A. $\sigma_{\tilde{f}}$ There exists a flag $W_{\bullet}$ such that $f$ lifts into a unique $\tilde{f}$ : $C \rightarrow \widetilde{X}_{W_{\bullet}}$, and $\left[\tilde{f}_{*}(C)\right]$ satisfies the conditions $(*)_{d}$.

Proof. Let $W_{\bullet}$ be an isotropic flag and $\left(x_{0}, x_{1}, x_{2}\right) \in f(C)^{3}$ as in Lemma A.5. Denote by $B$ the Borel subgroup of $\mathrm{SO}(5)$ corresponding to $W_{\bullet}$. Then the open $B$-orbit $\Omega$ in $\mathbb{Q}_{3}$ is the set of points $x$ such that $\bar{x}$ is not contained in $W_{1}^{\perp}$. Recall that, over $\Omega$, the morphism $\pi: \widetilde{X}_{W \cdot} \rightarrow \mathbb{Q}_{3}$ is an isomorphism. Thus, since $C$ is smooth and $f(C)$ intersects $\Omega$ (at least in $x_{0}$ ), $f$ lifts into a unique $\tilde{f}: C \rightarrow \widetilde{X}_{W_{\bullet}}$.
Moreover, we can compute that $\pi\left(\xi_{1}\right)=\left\{x \in \mathbb{Q}_{3} \mid \bar{x} \subset W_{1}^{\perp}\right\}$ and $\pi\left(\xi_{2}\right)=$ $\pi\left(\xi_{3}\right)=\left\{x \in \mathbb{Q}_{3} \mid \bar{x} \subset W_{2}\right\}$. So, for any $i \in\{1,2,3\}, \pi^{-1}(\Omega)$ does not intersect $\xi_{i}$ so that $\left[\tilde{f}_{*}(C)\right] \cdot \xi_{i} \geq 0$. Also, the existence of $x_{1}$ implies that $\left[\tilde{f}_{*}(C)\right] \cdot \xi_{1}>0$ and the existence of $x_{2}$ implies that $\left[\tilde{f}_{*}(C)\right] \cdot \xi_{2}>0$ or $\left[\tilde{f}_{*}(C)\right] \cdot \xi_{3}>0$.
Let us now explain why the set of flags that we can choose is of dimension 3. In the proof of Lemma A.5, we can note that, when $x_{0}, x_{1}, x_{2}$ are fixed in $f(C)^{3}$, we choose $W_{1}$ in a quadric of dimension 1 and $W_{2}$ is uniquely determined. Moreover, if $W_{\bullet}$ is fixed, then we have finitely many choices for $x_{1}$ and $x_{2}$ whereas the set of possible $x_{0}$ is one-dimensional. At the end, the dimension we are looking for is $3+1-1=3$.

Finally, let us prove the third fact.
Let $J$ be the scheme of morphisms from $C$ to $X$ of degree $d$ such that $f(C)$ is contained in an isotropic projective line of $\mathbb{P}(V)$. We have a natural projection from $J$ to the variety $\mathbb{G}_{Q}(2,5)$ of isotropic projective lines in $\mathbb{P}(V)$, which is of dimension 3. The fibers are isomorphic to the scheme $\mathbf{H o m}_{d}\left(C, \mathbb{P}^{1}\right)$ of morphisms of degree $d$ from $C$ to $\mathbb{P}^{1}$ and are of dimension $2 d$. The dimension of $J$ is therefore $2 d+3$. If $d \geq 4$, we have $2 d+3<3 d$ and then $J$ cannot be an irreducible component of $\operatorname{Hom}_{d}(C, X)$.

[^0]:    ${ }^{1}$ A homogeneous space $X$ is minuscule if the minimal representation $V$ defining an embedding $X \subset \mathbb{P}(V)$, also called the Plücker embedding, is a minuscule representation i.e. a representation of highest weight $\varpi$ with $\left|\left\langle\alpha^{\vee}, \varpi\right\rangle\right| \leq 1$ for all roots $\alpha$. The space $X$ is cominuscule if the above highest weight $\varpi$ is fundamental and its associated fundamental coweight is minuscule.

[^1]:    ${ }^{2}$ Recall that the upper central series $\left(Z^{k}(G)\right)_{k>0}$ of a group $G$ is defined by induction by $Z^{0}(G)=\{1\}, Z^{1}(G)=Z(G)$ the center of $G$ and $Z^{k+1}(G)$ is the (normal) subgroup of $G$ containing $Z^{k}(G)$ such that $Z^{k+1}(G) / Z^{k}(G)=Z\left(G / Z^{k}(G)\right)$.
