ABSTRACT. Necessary formulas are developed for obtaining cubic, quartic, quintic, and sextic spline solutions of nonlinear boundary value problems. These methods enable us to approximate the solution of the boundary value problems, as well as their successive derivatives smoothly. Numerical evidence is included to demonstrate the relative performance of these four techniques.

KEY WORDS AND PHRASES. Cubic, Quartic, Quintic and Sextic Spline Functions; Finite Difference Scheme; Noumerov's Formula; Newton's Method for Solving Nonlinear Algebraic Equations; Nonlinear Two Point Boundary Value Problem; Recurrence Relations.

1. PRELIMINARIES

Let a finite interval \([a, b]\) be partitioned into \((N + 1)\) equal parts by the
insertion of $N$ Knots $\{x_n\}$ defined by $x_n = a + nh$, $h = (b - a)/(N + 1)$, $n = 0(1)N + 1$, and let $s(x)$ be a spline function of degree $m$ on $[a, b]$. Thus, in each subinterval $[x_i, x_{i+1}]$, $s(x)$ is a polynomial of degree at most $m$ and $s(x) \in C^{m-1}[a, b]$. We shall designate this polynomial by

$$p_i(x) = \sum_{j=0}^{m} \alpha_{ij} (x - x_i)^j, \quad i = 0(1)N, \ x \in [x_i, x_{i+1}]. \quad (1.1)$$

In this paper we shall present some methods for the continuous approximation of the solution of the two point real nonlinear boundary value problem

$$\begin{align*}
y''(x) &= f(x, y(x)), \quad a \leq x \leq b \\
y(a) - A &= y(b) - B = 0
\end{align*} \quad (1.2)$$

by the use of spline functions of orders up to six. The function $f(x, y(x))$ is a continuous function of two variables with $f_y$ continuous and nonnegative in the strip $S$ defined by $S$: $a \leq x \leq b, -\infty < y < \infty$. It is well-known that the boundary value problem (1.2) with these conditions has a unique solution (Henrici [1], p. 347).

2. **CUBIC SPLINE SOLUTION ($m = 3$)**

The possibilities of using spline functions for obtaining smooth approximations of the solution of boundary value problems were first briefly discussed by Ahlberg et al. [2]. Following this, Bickley [3] and Albasiny et al. [4] have demonstrated the use of cubic spline function for obtaining an approximate solution of (1.2) when

$$f(x, y(x)) = p(x) y'(x) + q(x) y(x) + r(x).$$

The authors of the latter have, in particular, established via different notations than ours, the recurrence relation

$$y_{i-1} - 2y_i + y_{i+1} = (h^2/6)[M_{i-1} + 4M_i + M_{i+1}], \quad (1.3)$$
where \( y_i \) denotes spline approximation to \( y(x_i) \), \( y(x) \) being the exact solution of the system (1.2). The unknowns \( y_i \), \( i = 1(1)N \) are first obtained by solving the tridiagonal system of nonlinear algebraic equations (1.3), \( M_i, i = 0(1)N + 1 \) are subsequently computed by \( M_i = f_i, f_i = f(x_i, y_i) \) where we designate

\[ p_i(x_j) = y_j, \quad p_i'(x_j) = M_j, \quad x_j \in [x_i, x_{i+1}] \]  

Finally the coefficients of (1.1) are determined from the relations

\[
\begin{align*}
    a_{i,0} &= (M_{i+1} - M_i)/(6h), \quad a_{i,1} = M_i/2 \\
    a_{i,2} &= (y_{i+1} - y_i)/h - h(M_{i+1} + 2M_i)/6, \quad a_{i,3} = y_i.
\end{align*}
\]  

(1.4)

We can also show that

\[
y_i' = a_{i,2}, \quad i = 0(1)N
\]

\[
= (y_{N+1} - y_N)/h + h(2M_{N+1} + M_N)/6, \quad i = N + 1.
\]  

(1.5)

The approximate values of \( y(x) \) and its derivative at the points other than knots are obtained by evaluating or differentiating the corresponding cubic spline polynomial.

3. SOLUTION OF NONLINEAR EQUATIONS (1.3)

The method which we shall use to obtain the solution of the system (1.3) is a generalization of Newton's method which we summarize very briefly for the sake of completeness (Henrici [1], p.355). Let the nonlinear equations (1.3) in \( N \) unknown \( y_i \) be written in the form

\[
\phi_i(y_1, y_2, \ldots, y_N) = 0, \quad i = 1(1)N
\]  

(3.1)

or, in vector form,
\[ \phi(Y) = 0, \quad (3.2) \]

where \( \phi = (\phi_1) \), \( Y = (y_1) \) are \( N \) dimensional vectors. Let \( M(Y) = (m_{ij}) \) denote the matrix with elements

\[ m_{ij} = \frac{\partial \phi_i}{\partial y_j} \quad i, j = 1(1)N. \quad (3.3) \]

Then the Newton's method for the solution of (3.1) is written in the form

\[ Y^{(p+1)} = Y^{(p)} - [M(Y^{(p)})]^{-1} \phi(Y^{(p)}), \quad (p = 0, 1, \ldots). \quad (3.4) \]

In our case, the elements \( m_{ij} \) are given as follows:

\[ m_{ij} = \begin{cases} 2 + (4h^2/6)g_{ij}, & i = j \\ -1 + (h^2/6)g_{ij}, & |i - j| = 1 \\ 0, & |i - j| > 1 \end{cases} \quad (3.5) \]

where \( g_{ij} = f_y(x_i, y_i) \). The vector \( \phi(Y) \) is usually referred to as residual vector. The criterion for stopping the iterations defined by (3.4) is that the residual vector \( \phi(Y^{(p)}) \) be such that

\[ ||\phi(Y^{(p)})|| = \max_i |\phi_i(Y^{(p)})| < \epsilon, \quad (p = 0, 1, \ldots), \quad (3.6) \]

where \( \epsilon \) is a preassigned small positive quantity.

Also, the system of nonlinear equations (3.2) has a unique solution \( \bar{Y} \), to which the successive approximations \( Y^{(p)} \) defined by (3.4) converge, provided

\[ 0 < \sigma = a\beta \leq 0.5, \quad (3.7) \]

where for \( Y = Y^{(0)} \), the initial approximation, the matrix \( M(Y^{(0)}) \) has an inverse \( \Gamma \) such that
SPLINE SOLUTIONS FOR NONLINEAR PROBLEMS

\[ || \Gamma || \leq \alpha, \]  
\[ || \phi(y(0)) || \leq \beta, \]  
\[ \sum_{j,k=1}^{N} \left| \frac{\partial^2 \phi_i}{\partial y_j \partial y_k} \right| \leq \gamma, \quad i = 1(1)N, \]  

(Note for a vector \( v = (v_i) \), \( ||v|| = \max_i |v_i| \), and for a matrix \( M = (m_{ij}) \), \( ||M|| = \max_i \sum_j |m_{ij}| \).)

We can verify that (3.7) will be satisfied for the system (1.3) if

\[ h^2 G < 6 \text{ with } G = \max_{(x,y)} f, \text{ and } \]
\[ 64(b-a)^4 \left[ h^2 Q_4/12 + R \right] H \leq 1/2, \]  

where the function \( Q(x) \) providing the initial approximation is such that

\[ Q_4 = \max_x \left| \int_i^x v(x) \right|, \quad R = \max_x \left| Q''(x) - f(x, Q(x)) \right|, \text{ and } \]
\[ H = \max_{(x,y)} \left| f_{yy} \right|, \quad (x, y) \in S. \]  

In deriving (3.11), we use the theory of monotone matrices as given by Henrici ([1], p. 360). If the initial approximation vector \( y(0) = (Q(x_1)) \) be such that the quantity \( R \) is small, then it follows from (3.11) that the solution of the system (1.3) obtained by Newton's method will converge to the solution of (1.2) for all sufficiently small values of \( h \).

4. QUARTIC SPLINE SOLUTION

We now consider (1.1) for \( m = 4 \). With the analogy of section 2 on cubic spline, we can determine the five coefficients of (1.1) in terms of \( y_1, y_{i+1}, M_i, M_{i+1} \) and \( D_i \) where we now write
P_1'(x_i) = D_i, \quad x_i \in [x_i, x_{i+1}].

A simple calculation gives

\[ a_{i,0} = \frac{-(y_{i+1} - y_i)/h^4 + D_i/h^3 + (M_{i+1} + 2M_i)/(6h^2)}{4} \]
\[ a_{i,1} = \frac{2(y_{i+1} - y_i)/h^3 - 2D_i/h^2 - (M_{i+1} + 5M_i)/(6h)}{3} \]
\[ a_{i,2} = \frac{M_i/2, a_{i,3} = D_i, a_{i,4} = y_i, \quad i = 0(1)N.}{3} \]

Continuity of the first and third derivative at \( x = x_i \) gives the relations [that is \( P_i'(x_i) = P_i'(x_i) \) and \( P_i'''(x_i) = P_i'''(x_i) \)]

\begin{align*}
4h^3 a_{i-1,0} + 3h^2 a_{i-1,1} + 2ha_{i-1,2} + a_{i-1,3} &= a_{i,3} \\
4ha_{i-1,0} + a_{i-1,1} &= a_{i,1}
\end{align*}

which on using (4.1) reduce to

\[ D_i + D_{i-1} = 2(y_{i+1} - y_i)/h + h(M_i - M_{i-1})/6, \quad (4.3) \]

and

\[ D_i + D_{i-1} = (y_{i+1} - y_i)/h - h(M_{i+1} + 8M_i + M_{i-1})/12. \quad (4.4) \]

We equate the expressions on the right side of the equality sign in (4.3) and (4.4) respectively and obtain

\[ 2(y_{i+1} - y_i)/h + h(M_i - M_{i-1})/6 = (y_{i+1} - y_i)/h - h(M_{i+1} + 8M_i + M_{i-1})/12 \]

which collapses, on simplification, to the recurrence relation

\[ y_{i-1} - 2y_i + y_{i+1} = (h^2/12)[M_{i-1} + 10M_i + M_{i+1}], \quad (4.5) \]

which is the same as the well-known Noumerov's formula. As before, we first determine the unknowns \( y_i, i = 1(1)N \) by solving the system of nonlinear
algebraic equations by Newton's iterative method explained in the previous section and then compute \( D_i, i = 1(1)N+1 \), using (4.3) in conjunction with (Usmani, [5])

\[
D_0 = \left[ -y_0 + y_1 - \frac{h^2}{12}(5M_0 + M_1) - \frac{h^3}{12} \frac{\partial^2 f(x_0, y_0)}{\partial x} \right] \left[ h(1 + \frac{h^2}{12})g_0 \right].
\]

And now the knowledge of \( y_i, D_i, M_i, i = 0(1)N+1 \) enables us to produce the coefficients of quartic spline as given by (4.1). An approximation of the third derivative at knots is given by

\[
y'''_i = 6a_{1,1}, \quad i = 0(1)N
\]

\[
= 24hM_{i-1} + 6a_{N-1,1} = -12(y_{N+1} - y_N)/h^3 + 12D_N/h^2
\]

\[
+ 3(M_{N+1} + M_N)/h, \quad i = N+1.
\]

5. **QUINTIC SPLINE SOLUTION**

We now consider (1.1) for \( m=5 \).

Set \( p_i^v(x_j) = S_j, \quad x_j \in [x_i, x_{i+1}] \). As before, we can compute the coefficients of (1.1) in terms of \( y_i, y_{i+1}, M_i, M_{i+1}, S_i, S_{i+1} \) in the form (Spath, [6])

\[
a_{1,0} = (S_{i+1} - S_i)/(120h), \quad a_{1,1} = S_i/24
\]

\[
a_{1,2} = (M_{i+1} - M_i)/(6h) - h(S_{i+1} + S_i)/36, \quad a_{1,3} = M_i/2
\]

\[
a_{1,4} = (y_{i+1} - y_i)/h - h(M_{i+1} + 2M_i)/6 + h^3(7S_{i+1} + 8S_i)/360
\]

\[
a_{1,5} = y_i, \quad i = 0(1)N.
\]

From the continuity of first and third derivatives at \( x = x_i \), we have

\[
7S_{i+1} + 16S_i + 7S_{i-1} = 60(M_{i+1} + 4M_i + M_{i-1})/h^2 - 360(y_{i+1} - 2y_i + y_{i-1})/h^4, \quad (5.2)
\]

\[
S_{i+1} + 4S_i + S_{i-1} = 6(M_{i+1} - 2M_i + M_{i-1})/h^2. \quad (5.3)
\]

From the preceding two relations, it follows that
On substituting the values of $S_j, j = i-1, i, i+1$ either in (5.2) or in (5.3), we readily derive the desired relation

$$(y_{i-2} + y_{i+2}) + 2(y_{i-1} + y_{i+1}) - 6y_i = \left(\frac{h^2}{20}\right)[(M_{i-2} + M_{i+2}) + 26(M_{i-1} + M_{i+1}) + 66M_i],$$

(5.5)

This recurrence relation only gives $(N-2)$ equations in the $N$ unknowns $y_i$.

In an analogous manner we derive two more relations, namely

(i) $4y_0 - 7y_1 + 2y_2 + y_3 = \left(\frac{h^2}{12}\right)[4M_0 + 41M_1 + 14M_2 + M_3]$

(ii) $y_{N-2} + 2y_{N-1} - 7y_N + 4y_{N+1} = \left(\frac{h^2}{12}\right)[M_{N-2} + 14M_{N-1} + 41M_N + 4M_{N+1}].$ (5.6)

Now the determination of $N$ unknowns $y_i$ can be effected by solving the nonlinear algebraic equations (5.5) and (5.6). The knowledge of $y_i, i = 0(1)N+1$, enables us to compute $M_i, i = 0(1)N+1$ and finally $S_i, i = 1(1)N$ using (5.4). The quantities $S_0$ and $S_{N+1}$ can be computed from the formulas

(i) $S_0 = 0.1[(48/h^4)(-2y_0 + 5y_1 - 4y_2 + y_3 + h^2M_0) - 21S_1 - 12S_2 - S_3]$,

(ii) $S_{N+1} = 0.1[(48/h^4)(y_{N-2} - 4y_{N-1} + 5y_N - 2y_{N+1} + h^2M_{N+1}) - 21S_N$

$- 12S_{N-1} - S_{N-2}].$ (5.7)

In fact we use (5.7) for $N = 3$ and for $N>3$ we can use more accurate formulas obtained from

$y_{i-2} - 4y_{i-1} + 6y_i - 4y_{i+1} + y_{i+2} = \left(\frac{h^4}{120}\right)[S_{i-2} + 26S_{i-1} + 66S_i + 26S_{i+1} + S_{i+2}].$

(5.8)

which is easily derived on eliminating $M_i$'s from (5.2) and (5.3).

Finally, the knowledge of $y_i, M_i, S_i, i = 0(1)N+1$ enables us to write down the coefficients of (1.1) as given by (5.1). We also have
$y'_i = a_{i,4}$ \hspace{1cm} i = 0(1)N

$= (y_{N+1} - y_N)/h + h(2M_{N+1} + M_N)/6 - h^3(8S_{N+1} - 23S_N)/360,$ \hspace{1cm} (5.9)

$i = N + 1,$ and

$y'''_i = 6a_{i,2}$ \hspace{1cm} i = 0(1)N

$= (M_{N+1} - M_N)/h + h(2S_{N+1} + S_N)/6, \quad i = N+1.$ \hspace{1cm} (5.10)

6. **SEXTIC SPLINE SOLUTION**

We finally consider (1.1) for $m = 6$. With the analogy of the previous sections, we compute the coefficients of (1.1) in terms of $y_i, y_{i+1}, D_i, M_i, M_{i+1}, S_i,$ and $S_{i+1}$ in the form

$$a_{i,0} = (y_{i+1} - y_i)/(3h^6) - D_i/(3h^5) - (M_{i+1} + 2M_i)/(18h^4)$$

$$+ (7S_{i+1} + 8S_i)/(1080h^2),$$

$$a_{i,1} = -(y_{i+1} - y_i)/h^5 + D_i/h^4 + (M_{i+1} + 2M_i)/(6h^3)$$

$$- (4S_{i+1} + 11S_i)/(360h),$$

$$a_{i,2} = S_i/24,$$

$$a_{i,3} = 5(y_{i+1} - y_i)/(3h^3) - 5D_i/(3h^2) - (2M_{i+1} + 13M_i)/(18h)$$

$$+ h(S_{i+1} - 4S_i)/216,$$

$$a_{i,4} = M_i/2, \quad a_{i,5} = D_i, \quad a_{i,6} = y_i, \quad i = 0(1)N.$$

Continuity of the first, third, and fifth derivatives at $x = x_i$ gives the relations

$$D_i + D_{i-1} = 2(y_i - y_{i-1})/h + h(M_i - M_{i-1})/6 - h^3(S_i - S_{i-1})/360,$$ \hspace{1cm} (6.2)
\[ D_1 + D_{i-1} = \frac{(y_{i+1} - y_{i-1})}{h} - \frac{h(2M_{i+1} + 21M_i + 7M_{i-1})}{30} + h^3(S_{i+1} + 9S_i) \]  
\[ D_1 + D_{i-1} = \frac{(y_{i+1} - y_{i-1})}{h} - \frac{h(M_{i+1} + 3M_i + 2M_{i-1})}{6} + h^3(4S_{i+1} + 21S_i) \]

From (6.2), (6.3) and (6.2), (6.4), we derive the following relations

\[ y_{i+1} - 2y_i + y_{i-1} = \frac{h^2(M_{i+1} + 13M_i + M_{i-1})}{15} - h^4(S_{i+1} - 8S_i) \]  
\[ + S_{i-1})/360, \]  
\[ y_{i+1} - 2y_i + y_{i-1} = \frac{h^2(M_{i+1} + 4M_i + M_{i-1})}{6} - h^4(2S_{i+1} + 11S_i) \]  
\[ + 2S_{i-1})/180. \]

From (6.5) and (6.6), we deduce

\[ h^4S_i = 20(y_{i+1} - 2y_i + y_{i-1}) - 2h^2(M_{i+1} + 28M_i + M_{i-1})/3, \]  
\[ h^2M_i = (y_{i+1} - 2y_i + y_{i-1}) - h^4(S_{i+1} + 28S_i + S_{i-1})/360. \]

From (6.5) and (6.7) [Note we can also use (6.6) and (6.7)], we obtain on eliminating \( S_i \) the recurrence relation

\[ (y_{i-2} + y_{i+2}) + 8(y_{i-1} + y_{i+1}) - 18y_i \]  
\[ = (h^2/30)[(M_{i-2} + M_{i+2}) + 56(M_{i-1} + M_{i+1}) + 246M_i], \]  
\[ i = 2(1)N-1, \]  
which gives (N-2) nonlinear algebraic equations in the N unknowns \( y_i \). We develop two more equations similar to those given by (5.6) in the form

\[ (i) \ 10y_0 - 19y_1 + 8y_2 + y_3 = (h^2/12)[10M_0 + 101M_1 + 20M_2 + M_3], \]  
\[ (ii) \ y_{N-2} + 8y_{N-1} - 19y_N + 10y_{N+1} = (h^2/12)[M_{N-2} + 20M_N + 101M_N + 10M_{N+1}]. \]
We first solve (6.9) and (6.10) and determine \( y_n \), \( n = 1(1)N \); \( M_i \) are then determined as before. The knowledge of \( y_i \) and \( M_i \) enables us to compute \( S_i \), \( i = 1(1)N \) using (6.7). As in section 5, \( S_0 \) and \( S_{N+1} \) are computed from (5.7) or (5.8) depending according as \( N = 3 \) or \( N > 3 \). Having determined \( y_i \), \( M_i \), \( S_i \), \( i = 0(1)N+1 \), we evaluate the coefficients of (1.1) as given by (6.1).

The first derivatives at the knots are computed recursively from the formula (6.2) using the starting value for the first derivative as given below (see Usmani [7], eqn. 3.6 (i)):

\[
D_0 = \frac{-5.5y_0 + 9y_1 - 4.5y_2 + y_3 - h^4(8S_0 + 15S_1 + 52S_2 - S_3)/280}{(3h)} \tag{6.11}
\]

This formula is suitable for \( N = 3 \). However, for \( N > 3 \), a more accurate formula, namely

\[
D_0 = \frac{-5.5y_0 + 9y_1 - 4.5y_2 + y_3 - h^4 \sum_{n=0}^{5} \beta_n S_n}{(3h)} \tag{6.12}
\]

where \( (\beta_0, \beta_1, \ldots, \beta_5) = \frac{1}{33600} (937, 18240, 5990, 140, -135, 28) \), could be used (see Usmani, [7], eqn. 3.7(i)).

Finally, the third and fifth derivatives are given by the following formulas:

\[
y''_i = 6a_{i,3}, \quad i = 0(1)N \tag{6.13}
\]

\[
y'''_{N+1} = -10(y_{N+1} - y_N) + 10D_N/h^2 + (8M_{N+1} + 7M_N)/(3h) + h(5S_{N+1} + 2S_N)/36,
\]

\[
y^{(5)} = 120a_{i,1}, \quad i = 0(1)N \tag{6.14}
\]

\[
y^{(5)}_{N+1} = 120(y_{N+1} - y_N)/h^5 - 120D_N/h^4 - 20(M_{N+1} + 2M_N)/h^3
+ 5(11S_{N+1} + 10S_N)/(6h).
\]

7. CONVERGENCE

Define
\[ e_i = y(x_i) - y_i \]

and \( E = (e_n) \), \( T = (t_n) \) are \( N \)-dimensional vectors; then the error equation in any of the four methods is obtained in a standard manner in the form

\[ ME = T \quad (7.1) \]

where \( M \) is a tridiagonal matrix for cubic and quartic spline functions and \( M \) is a five band matrix for quintic and sextic spline solutions of the boundary value problem (1.2). It is easily seen that the truncation error associated with (1.3) is \( O(h^4) \) and \( ||M^{-1}|| \leq (b - a)^2/(8h^2) \) where the elements of \( M \) are given by (3.5). Thus we easily deduce that for a cubic spline solution of (1.2) (Henrici, [1])

\[ ||E|| \leq Kh^2 \quad (7.2) \]

and, from this, it follows that as \( h \to 0 \) (i.e. \( N \to \infty \)) the cubic spline solution \( y_i \to y(x_i) \). Thus cubic spline solution based on (1.3) is a second order convergent process. We can similarly prove that the quartic spline solution based on (4.5) is a fourth order convergent process.

In order to prove the convergence of the quintic solution based on (5.5) and (5.6), we observe that the truncation error is given by

\[
    t_1 = \begin{cases} 
        - \frac{h^6 y^{(6)}(\omega_1)}{48}, & x_0 < \omega_1 < x_3 \\
        \frac{h^6 y^{(6)}(\omega_i)}{120} + \frac{6h^7}{i = 2(1)N-2} \\
        - \frac{h^6 y^{(6)}(\omega_N)}{48}, & x_{N-2} < \omega_N < x_{N+1} 
    \end{cases} 
\]

We can establish that

\[ ||T|| \leq h^6 M_6 / 48, \quad M_6 = \max_x \left| y^{(6)}(x) \right|. \quad (7.4) \]

The elements of the corresponding matrix \( M \) are given below

\[
    m_{12} = -2 + (14h^2 g_2 / 12), \quad m_{N,N-1} = -2 + (14h^2 g_{N-1} / 12) \quad (7.5)
\]
The error analysis depends on the properties of the matrix $M$ and $\tilde{M}$ where $\tilde{M}$ is a five band matrix obtained from $M$ by setting each $g_i = 0$, so that $\tilde{M} = (\tilde{m}_{ij})$ and

$$\tilde{m}_{11} = \tilde{m}_{N,N} = 7,$$

$$\tilde{m}_{ij} = 6, \quad i = j, \quad i = 2(1)N-1$$

$$= -2, \quad |i = j| = 1$$

$$= -1, \quad |i - j| = 2$$

$$= 0, \text{ otherwise}.$$  

From the theory of monotone matrices (Henrici, [1]), it follows that both $M$ and $\tilde{M}$ are monotone matrices if $13h^2G < 20$. Also, it is easily seen that

$$\tilde{M} = PQ,$$

where $P = (p_{ij})$, $Q = (q_{ij})$ are tridiagonal matrices with $p_{11} = 2$, $p_{ij} = -1$, $|i - j| = 1$; $q_{11} = 4$, $q_{ij} = 1$, $|i - j| = 1$. Also,

$$M^{-1} \leq \tilde{M}^{-1} = [p^{-1} + Q^{-1}] / 6,$$  

and
This follows from Fischer and Usmani [8]. Now from (7.1), (7.4), and (7.9), it follows that

$$||E|| \leq h^4(b - a)^2M_6/2304 + O(h^6) = O(h^4).$$  \hspace{2cm} (7.10)

Following a similar technique, we can establish that for a sextic spline solution

$$||E|| \leq \tilde{h}^6.$$  \hspace{2cm} (7.11)

8. NUMERICAL ILLUSTRATIONS

We solve two nonlinear boundary value problems of the form (1.2).

$$y'' = 0.5(x + y + 1)^3, \quad y(0) = y(1) = 0,$$

with $y(x) = 2/(2 - x) - x - 1$. The function $Q(x)$ is chosen to satisfy the system $Q'' = 0.5(x + 1)^3$, $Q(0) = Q(1) = 0$ so that $Q(x) = [(1 + x)^5 - 31x - 1]/40$;

$$y'' = \exp(y), \quad y(0) = y(1) = 0,$$

with $y(x) = - \ln(2) + 2 \ln[C \sec[C(x - 0.5)/2]], \quad C = 1.3360557$.

Here $Q(x) = [\sinh x + \sinh (1 - x)]/\sinh 1 - 1$. The numerical calculations are made using double precision arithmetic in order to keep the rounding errors to a minimum. The numerical results are briefly summarized in Tables 1 - 3.

9. CONCLUDING REMARKS

Our numerical results on test problems indicate that results based on quintic and sextic spline are only marginally better than those obtained by quartic spline solution. Moreover, in order to obtain nonlinear equations equal to the number of unknowns in quintic and sextic spline solution, an ad hoc procedure is used near the boundaries of the interval. Also, the matrices that arise are five band matrices whereas in case of cubic and
quartic spline solution the bandwidth of the matrices that arise is three, which makes them slightly simpler to implement. Since formulas (1.3) and (4.5) satisfy the conditions of Theorem 7.4 (Henrici [1]), Richardson's \( h^2 \) - extrapolation method can be used to push the accuracy of these formulas to \( O(h^4) \) and \( O(h^6) \) respectively, whereas in case of quintic and sextic spline solutions we can only use \( h \)-extrapolation technique to improve the numerical solution. The latter techniques also suffer from a disadvantage that they require approximate formulas for \( S_0 \) and \( S_{N+1} \) [see (5.7)]. Similarly, in sextic spline solution, in order to compute \( D_i \), \( i = 1(1)N+1 \), we must provide \( D_0 \) [see (6.11)].

Finally, in the opinion of this author, one should rely on quartic spline solution for a smooth approximation of the solution and its successive derivates for the nonlinear boundary value problem of the type (1.2).

Special Issue on
Time-Dependent Billiards

Call for Papers

This subject has been extensively studied in the past years for one-, two-, and three-dimensional space. Additionally, such dynamical systems can exhibit a very important and still unexplained phenomenon, called as the Fermi acceleration phenomenon. Basically, the phenomenon of Fermi acceleration (FA) is a process in which a classical particle can acquire unbounded energy from collisions with a heavy moving wall. This phenomenon was originally proposed by Enrico Fermi in 1949 as a possible explanation of the origin of the large energies of the cosmic particles. His original model was then modified and considered under different approaches and using many versions. Moreover, applications of FA have been of a large broad interest in many different fields of science including plasma physics, astrophysics, atomic physics, optics, and time-dependent billiard problems and they are useful for controlling chaos in Engineering and dynamical systems exhibiting chaos (both conservative and dissipative chaos).

We intend to publish in this special issue papers reporting research on time-dependent billiards. The topic includes both conservative and dissipative dynamics. Papers discussing dynamical properties, statistical and mathematical results, stability investigation of the phase space structure, the phenomenon of Fermi acceleration, conditions for having suppression of Fermi acceleration, and computational and numerical methods for exploring these structures and applications are welcome.

To be acceptable for publication in the special issue of Mathematical Problems in Engineering, papers must make significant, original, and correct contributions to one or more of the topics above mentioned. Mathematical papers regarding the topics above are also welcome.

Authors should follow the Mathematical Problems in Engineering manuscript format described at http://www.hindawi.com/journals/mpe/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:

<table>
