# A Note On Perfect Totient Numbers 

Moujie Deng ${ }^{1}$<br>Department of Applied Mathematics College of Information Science and Technology<br>Hainan University<br>Haikou 570228<br>P. R. China<br>dmj2002@hotmail.com

#### Abstract

In this note we prove that there are no perfect totient numbers of the form $3^{k} p$, $k \geq 4$, where $s=2^{a} 3^{b}+1, r=2^{c} 3^{d} s+1, q=2^{e} 3^{f} r+1$, and $p=2^{g} 3^{h} q+1$ are primes with $a, c, e, g \geq 1$, and $b, d, f, h \geq 0$.

## 1 Introduction

Let $\phi$ denote Euler's totient function. Define $\phi^{1}(n)=\phi(n)$ and $\phi^{k}(n)=\phi\left(\phi^{k-1}(n)\right)$ for all integers $n>2, k \geq 2$. Let $c$ be the smallest positive integer such that $\phi^{c}(n)=1$. Define the arithmetic function $S$ by

$$
S(n)=\sum_{k=1}^{c} \phi^{k}(n) .
$$

We say that $n$ is a perfect totient number (or PTN for short) if $S(n)=n$.
There are infinitely many PTNs, since it is easy to show that $3^{k}$ is a PTN for all positive integers $k$. Perez Cacho [6] proved that $3 p$, for an odd prime $p$, is a PTN if and only if $p=4 n+1$, where $n$ is a PTN. Mohan and Suryanarayana [5] proved that $3 p$, for an odd prime $p$, is not a PTN if $p \equiv 3(\bmod 4)$. Thus PTNs of the form $3 p$ have been completely characterized. D. E. Iannucci, the author and G. L. Cohen [3] investigated PTNs of the form $3^{k} p$ in the following cases:

1. $k \geq 2, p=2^{c} 3^{d} q+1$ and $q=2^{a} 3^{b}+1$ are primes with $a, c \geq 1$ and $b, d \geq 0$;

[^0]2. $k \geq 2, p=2^{e} 3^{f} q+1, q=2^{c} 3^{d} r+1$ and $r=2^{a} 3^{b}+1$ are all primes with $a, c, e \geq 1$ and $b, d, f \geq 0$;
3. $k \geq 3, p=2^{g} 3^{h} q+1, q=2^{e} 3^{f} r+1, r=2^{c} 3^{d} s+1$ and $s=2^{a} 3^{b}+1$, are all primes with $a, c, e, g \geq 1, b, d, f, h \geq 0$.

In the first case, they determined all PTNs for $k=2,3$ and proved that there are no PTNs of the form $3^{k} p$ for $k \geq 4$ by solving the related Diophantine equations. In the remaining cases, they only found several PTNs by computer searches. The author ([1, 2]) gave all solutions to the Diophantine equations $2^{x}-2^{y} 3^{z}-2 \cdot 3^{u}=9^{k}+1$, and $2^{x}-2^{y} 3^{z}-4 \cdot 3^{w}=3 \cdot 9^{k}+1$, which shows that there are no PTNs of the form $3^{k} p$ for $k \geq 4$ in the second case mentioned above.

In general, let $\mathcal{M}$ be the set of all perfect totients, I. E. Shparlinski [7] has shown that $\mathcal{M}$ is of asymptotic density zero, and F. Luca [4] showed that $\sum_{m \in \mathcal{M}} \frac{1}{m}$ converges.

The purpose of this note is to prove that, in the third case mentioned above, there are no PTNs of the form $3^{k} p$ for $k \geq 4$.

## 2 Lemmas

We first deduce related Diophantine equations. Let $k \geq 3, n=3^{k} p$. Suppose all of $s=$ $2^{a} 3^{b}+1, r=2^{c} 3^{d} s+1, q=2^{e} 3^{f} r+1$, and $p=2^{g} 3^{h} q+1$ are prime with $a, c, e, g \geq 1$, $b, d, f, h \geq 0$. If $n$ is a PTN, then $S(n)=n$ by definition, which implies the diophantine equation

$$
\begin{equation*}
2^{g}\left(2^{e}\left(2^{c}\left(2^{a}-3^{d+f+h+k-3}\right)-3^{f+h+k-2}\right)-3^{h+k-1}\right)=3^{k}+1 . \tag{1}
\end{equation*}
$$

Apparently, $g=1$ or 2 for $k$ even or odd, respectively. Next, according to $k=2 k_{1}$ or $k=2 k_{1}+1$, we consider more general Diophantine equations

$$
\begin{equation*}
2^{x}-2^{y} 3^{z}-2^{u} 3^{v}-2 \cdot 3^{w}=9^{k_{1}}+1 \tag{2}
\end{equation*}
$$

with $x \geq 4, y, u, w>0, z, v \geq 0, k_{1} \geq 2$, and

$$
\begin{equation*}
2^{x}-2^{y} 3^{z}-2^{u} 3^{v}-4 \cdot 3^{w}=3 \cdot 9^{k_{1}}+1 \tag{3}
\end{equation*}
$$

with $x \geq 4, y, u, w>0, z, v \geq 0, k_{1} \geq 1$, respectively. Since the terms $2^{y} 3^{z}$ and $2^{u} 3^{v}$ have symmetry in (2) and (3), we need only determine the solutions ( $x, y, z, u, v, w, k)$ to (2) and (3) such that $y>u$ or $y=u, z \geq v$.

Let $\left(x, y, z, u, v, w, k_{1}\right)$ be any solution to the equation (2) (or (3)), and let

$$
\left(x, y, z, u, v, w, k_{1}\right) \equiv(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu,)(\bmod 36,36,36,36,36,36,18)
$$

denote $x \equiv \alpha(\bmod 36), y \equiv \beta(\bmod 36), z \equiv \gamma(\bmod 36), u \equiv \delta(\bmod 36), v \equiv \lambda(\bmod 36)$, $w \equiv \mu(\bmod 36)$, and $k_{1} \equiv \nu(\bmod 18)$. In solving equation (2) and equation (3), we first determine all the $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$.

Lemma 1. Let $\left(x, y, z, u, v, w, k_{1}\right)$ be any solution to the equation (2), and let

$$
\left(x, y, z, u, v, w, k_{1}\right) \equiv(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu)(\bmod 36,36,36,36,36,36,18)
$$

Then all the possible $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ with $36 \geq \alpha, \beta, \delta, \lambda \geq 1,35 \geq \gamma, \lambda \geq 0,19 \geq \nu \geq 2$, $\beta>\delta$ or $\beta=\delta$ and $\gamma \geq \lambda$ are listed in Table 1 and Table $1^{\prime}$.

Proof: Since

$$
2^{36} \equiv 1(\bmod 5 \cdot 7 \cdot 13 \cdot 19 \cdot 37 \cdot 73), 3^{36} \equiv 1(\bmod 5 \cdot 7 \cdot 13 \cdot 19 \cdot 37 \cdot 73)
$$

$\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ must satisfy

$$
\begin{equation*}
2^{\alpha}-2^{\beta} 3^{\gamma}-2^{\delta} 3^{\lambda}-2 \cdot 3^{\mu} \equiv 9^{\nu}+1 \quad(\bmod 5 \cdot 7 \cdot 13 \cdot 19 \cdot 37 \cdot 73) \tag{4}
\end{equation*}
$$

But note that $2^{x} \equiv 0\left(\bmod 2^{4}\right), 9^{k_{1}} \equiv 0\left(\bmod 3^{3}\right), 2^{36} \equiv 1\left(\bmod 3^{3}\right), 3^{36} \equiv 1\left(\bmod 2^{4}\right)$; $M=36 l+m$ implies $2^{M} \equiv 0$ or $2^{m}\left(\bmod 2^{4}\right)$ and $3^{M} \equiv 0$ or $3^{m}\left(\bmod 3^{3}\right)$. Hence $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ must satisfy one of the 4 congruences

$$
\begin{equation*}
-2^{\beta} \cdot B \cdot 3^{\gamma}-2^{\delta} \cdot D \cdot 3^{\lambda}-2 \cdot 3^{\mu} \equiv 9^{\nu}+1 \quad\left(\bmod 2^{4}\right) \tag{5}
\end{equation*}
$$

and one of the 8 congruences

$$
\begin{equation*}
2^{\alpha}-2^{\beta} 3^{\gamma} \cdot C-2^{\delta} 3^{\lambda} \cdot E-2 \cdot 3^{\mu} \cdot F \equiv 1 \quad\left(\bmod 3^{3}\right), \tag{6}
\end{equation*}
$$

where $B, C, D, E, F$ take value 0,1 independently. The congruences (4), (5) and (6) were tested on a computer with a program written in UBASIC. All the $(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu)$ that satisfy (4), (5) and (6) are divided into two parts: those listed in Table 1 are in fact solutions to equation (2), and the remainder, listed in Table $1^{\prime}$, are not.

Similarly, we have
Lemma 2. Let $\left(x, y, z, u, v, w, k_{1}\right)$ be any solution to the equation (3), and let

$$
(x, y, z, u, v, w, k) \equiv(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu)(\bmod 36,36,36,36,36,36,18)
$$

Then all the possible $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ with $36 \geq \alpha, \beta, \delta, \mu \geq 1,35 \geq \gamma, \lambda \geq 0,18 \geq \nu \geq 1$, $\beta>\delta$ or $\beta=\delta$ and $\gamma \geq \lambda$ are listed in Table 2 and Table $2^{\prime}$.

Lemma 3. Let ( $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ ) be any solution to equation (2) or (3) that is listed in Table 1 or Table 2, and suppose

1. $\alpha>\beta>\delta$; or
2. $\alpha>\beta+2, \beta=\delta$;
holds. Then there is no other solution $(x, y, \gamma, u, \lambda, \mu, \nu)$ to equation (2) or (3) that satisfies $(x, y, u) \equiv(\alpha, \beta, \delta)(\bmod 36,36,36)$

Proof: Let $x=\alpha+36 i, y=\beta+36 j, u=\delta+36 l$. We have

$$
\begin{equation*}
2^{\alpha}\left(2^{36 i}-1\right)=2^{\beta} 3^{\gamma}\left(2^{36 j}-1\right)+2^{\delta} 3^{\lambda}\left(2^{36 l}-1\right) \tag{7}
\end{equation*}
$$

In case 1 , consideration of (7), modulo $2^{\beta}$ and $2^{\alpha}$ in turn gives $l=0$ and $j=0$. Hence we have $i=0$. In case 2 , since $3^{\gamma}+3^{\lambda} \equiv 2,4(\bmod 8)$, consideration of (7), modulo $2^{\alpha}$, gives $j=l=0$, and therefore $i=0$.

## 3 Main Results

Theorem 1. All the solutions to equation (2) are given by $\left(x, y, z, u, v, w, k_{1}\right)=(\alpha, \beta, \gamma, \delta, \lambda$, $\mu, \nu)$ with $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ listed in Table 1.

Proof: Let $\left(x, y, z, u, v, w, k_{1}\right)$ be any solution to equation (2), and let

$$
\left(x, y, z, u, v, w, k_{1}\right) \equiv(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu)(\bmod 36,36,36,36,36,36,18)
$$

By Lemma 1, all of $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ are listed in Table 1 or Table 1'. Put $x=\alpha+36 i, y=$ $\beta+36 j, z=\gamma+36 l, u=\delta+36 m, v=\lambda+36 n, w=\mu+36 t, k_{1}=\nu+18 t_{1}$. Then we must have

$$
2^{\alpha+36 i}-2^{\beta+36 j} \cdot 3^{\gamma+36 l}-2^{\delta+36 m} \cdot 3^{\lambda+36 n}-2 \cdot 3^{\mu+36 t} \equiv 9^{\nu+36 t_{1}}+1 \quad(\bmod 11 \cdot 31 \cdot 181 \cdot 331 \cdot 631)
$$

For $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ appearing in Table 1 , since $2^{180} \equiv 3^{360} \equiv 1(\bmod 11 \cdot 31 \cdot 181 \cdot 331 \cdot 631)$, we first test (8) within

$$
4 \geq i \geq 0,4 \geq j \geq 0,9 \geq l \geq 0,4 \geq m \geq 0,9 \geq n \geq 0,9 \geq t \geq 0,9 \geq t_{1} \geq 0
$$

With computer assistance, it follows that $l=n=t=t_{1}=0$ in this case. Since any $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ that listed in Table 1 satisfy the conditions of Lemma 3, we must have $i=j=m=0$ by Lemma 3 .

For $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ appearing in Table $1^{\prime}$, since $(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu)$ is not a solution to equation(2), we have $i \geq 1$. The congruence (8) was then tested on a computer within the ranges

$$
5 \geq i \geq 1,4 \geq j \geq 0,9 \geq l \geq 0,4 \geq m \geq 0,9 \geq n \geq 0,9 \geq t \geq 0,9 \geq t_{1} \geq 0
$$

with no $\left(i, j, l, m, n, t, t_{1}\right)$ being found, which shows that $\left(x, y, z, u, v, w, k_{1}\right)$ cannot be a solution to equation (2).
Theorem 2. All the solutions to equation (3) are given by $\left(x, y, z, u, v, w, k_{1}\right)=(\alpha, \beta, \gamma, \delta, \lambda$, $\mu, \nu)$ with $\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu$ listed in Table 2 .
Proof: The proof is basically the same as that for theorem 1, with the only difference being that $(\alpha, \beta, \gamma, \delta, \lambda, \mu, \nu)=(9,7,0,7,0,1,2)$, listed in Table 2, does not satisfy the conditions of Lemma 3. Suppose that $x=9+36 i, y=7+36 j, z=36 l, u=7+36 m, v=36 n, w=1+$ $36 t, k_{1}=2+36 t_{1}$ is a solution to equation (3). Then a computer test of the related congruence within $4 \geq i \geq 0,4 \geq j \geq 0,9 \geq l \geq 0,4 \geq m \geq 0,9 \geq n \geq 0,9 \geq t \geq 0,9 \geq t_{1} \geq 0$ gives $l=n=t=t_{1}=0$. Consideration of (7) with $\alpha, \beta, \gamma, \delta, \lambda$ replaced by $9,7,0,7,0$, modulo $2^{7}$, gives $j=l=0$. Therefor $i=0$.
Theorem 3. There are no PTNs of the form $3^{k} p, k \geq 4$, where all of $s=2^{a} 3^{b}+1$, $r=2^{c} 3^{d} s+1, q=2^{e} 3^{f} r+1$, and $p=2^{g} 3^{h} q+1$ are prime with $a, c, e, g \geq 1, b, d, f, h \geq 0$.

Proof: Suppose ( $a, c, d, e, f, g, h, k$ ) is a solution to equation (1). Let $x=a+c+e+g$, $y=c+e+g, z=d+f+k-3, u=e+g, v=f+h+k-2, w=h+k-1$, and $k_{1}=\frac{k}{2}$ or $k_{1}=\frac{k-1}{2}$ for $k$ even or odd, respectively. Then ( $x, y, z, u, v, w, k_{1}$ ) must be a solution to equation (2) or equation (3). From the first two theorems it follows that the only solutions to equation(1) are $(a, c, d, e, f, h, k)=(4,1,0,1,2,1,3),(1,2,0,4,0,0,3),(3,1,0,4,1,0,3),(2,2,1,4,0,0,3)$, $(8,1,4,1,0,1,3),(5,1,2,4,1,0,3),(4,2,0,4,2,0,3)$.

## 4 Acknowledgments

The author thanks Professor G. L. Cohen and Professor Huishi Li for useful advice and the referee for helpful suggestions which improved the quality of this paper.
