# ON THREE CONJECTURES INVOLVING THE SIGNLESS LAPLACIAN SPECTRAL RADIUS OF GRAPHS

Lihua Feng and Guihai Yu

Communicated by Slobodan K. Simić

ABSTRACT. We study the signless Laplacian spectral radius of graphs and prove three conjectures of Cvetković, Rowlinson, and Simić [*Eigenvalue bounds for the signless Laplacian*, Publ. Inst. Math., Nouv. Sér. 81(95) (2007), 11–27].

## 1. Introduction

In this paper, we consider only simple connected graphs and follow the notation of [1]. Let G be a simple graph with vertex set V(G) and edge set E(G). The *adjacency matrix of* G is  $A(G) = (a_{ij})$ , where  $a_{ij} = 1$  if two vertices i and j are adjacent in G and  $a_{ij} = 0$  otherwise. The characteristic polynomial of G is just  $P_G(x) = \det(xI - A(G))$ . Let D(G) be the diagonal degree matrix of G. We call the matrix L(G) = D(G) - A(G) the Laplacian matrix of G, and the matrix Q(G) = D(G) + A(G) the signless Laplacian matrix or Q-matrix of G. We denote the largest eigenvalues of A(G), L(G), Q(G) by  $\rho(G)$ ,  $\lambda(G)$ ,  $\mu(G)$ , respectively, and call them the adjacency spectral radius, the Laplacian spectral radius, the signless Laplacian spectral radius (or the Q-spectral radius) of G, respectively.

The study of the signless Laplacian spectral radius has recently attracted researchers' attention. In [10], Fan et al. studied the signless Laplacian spectral radius of bicyclic graphs with fixed order. In [9], the authors discussed the smallest eigenvalue of Q(G) as a parameter reflecting the nonbipartiteness of the graph G. In [7], the authors studied the smallest signless Laplacian eigenvalue of non-bipartite graphs. In [11], the extremal graphs with maximal signless Laplacian spectral radius and fixed diameter were studied. More information about the signless Laplacian can be found in [2], [3], [5], [6]. For more information about the spectral radius of graphs, the reader can refer to [4].

In [5], the authors proposed the following conjectures and in this paper we confirm that they are true.

THEOREM 1.1. [5, Conjecture 6] Let G be a connected graph of order  $n \ge 4$ . Then

$$u(G) - \frac{4m}{n} \leqslant n - 4 + \frac{4}{n}.$$

Equality holds if and only if  $G = K_{1,n-1}$ .

THEOREM 1.2. [5, Conjecture 7] Let G be a connected graph of order  $n \ge 5$ . Then

$$\mu(G) - \frac{2m}{n} \leqslant n - 1.$$

Equality holds if and only if  $G = K_n$ .

THEOREM 1.3. [5, Conjecture 10] Let G be a connected graph of order  $n \ge 4$ . Then

$$\mu(G) - \lambda(G) \leqslant n - 2.$$

Equality holds if and only if  $G = K_n$ .

# 2. Lemmas and results

Let G be a connected graph. The degree of u in G is denoted by  $d_u$ , the average degree of u, denoted by  $m_u$ , satisfies  $d_u m_u = \sum_{uv \in E} d_v$ , where E = E(G).

LEMMA 2.1. [8] Let G be a graph with n vertices, and m edges. Then

$$max\{d_v + m_v \mid v \in V(G)\} \leqslant \frac{2m}{n-1} + n - 2,$$

with equality if and only if  $K_{1,n-1} \subseteq G$  or  $G = K_{n-1} \cup K_1$ .

LEMMA 2.2. [12] Let  $M = (m_{ij})$  be an  $n \times n$  irreducible nonnegative matrix with spectral radius  $\rho(M)$ , and let  $R_i(M)$  be the *i*th row sum of M, *i.e.*,  $R_i(M) = \sum_{j=i}^{n} m_{ij}$ . Then

$$\min\{R_i(M) \mid \leq i \leq n\} \leq \rho(M) \leq \max\{R_i(M) \mid 1 \leq i \leq n\}.$$

Moreover, if the row sums of M are not all equal, then both above inequalities are strict.

LEMMA 2.3. Let G be a connected graph. Then  $\mu(G) \leq \max\{d_v + m_v \mid v \in V(G)\}$ , with equality holding if and only if G is either semiregular bipartite or regular.

PROOF. We consider the matrix  $K = D^{-1}QD$ , where the row sum corresponding to the vertex u is  $d_u + m_u$ . From Lemma 2.2, we obtain the required upper bound for  $\mu(G)$ .

If equality holds, then by Lemma 2.2, for a neighbor v of u,  $d_u + m_u = d_v + m_v$ , thus  $\sum_{uv \in E} (d_u + m_u) = \sum_{uv \in E} (d_v + m_v)$ , that is  $d_u^2 + d_u m_u = d_u m_u + \sum_{uv \in E} m_v$ . So we get

$$d_u^2 = \sum_{uv \in E} m_v.$$

36

Suppose  $d_u$  is the maximum degree. Then  $d_v m_v = \sum_{wv \in E} d_w \leq d_u d_v$ , whence  $m_v \leq d_u$  for all  $v \in V(G)$ . Since  $d_u^2 = \sum_{uv \in E} m_v \leq d_u^2$ , we have for any edge  $uv, d_u = m_v$ , and  $d_u d_v = d_v m_v$ , that is,  $\sum_{wv \in E} (d_u - d_w) = 0$ . Since  $d_u$  is the maximum degree, we have  $d_u = d_w$  whenever there exists a vertex v such that  $uv, vw \in E$ .

If G does not contain odd cycles, then G is bipartite. Suppose  $V = S \cup T$  is a bipartion and  $u \in T$ ; then  $v \in S$ ,  $w \in T$ . This implies that the vertices in T have the same degree. Similarly, the vertices in S also have the same degree. So G is semiregular bipartite.

If G contains odd cycles, then G must be regular.

The converse is easy to check.

LEMMA 2.4. Let G be a connected graph with n vertices and m edges. Then

$$\mu(G) \leqslant \frac{2m}{n-1} + n - 2,$$

with equality if and only if G is  $K_{1,n-1}$  or  $K_n$ .

PROOF. By Lemmas 2.1 and 2.3, we can get the result. Note that  $K_{1,n-1}$  is the only semiregular bipartite graph and  $K_n$  is the only regular graph that arises in the case of equality.

Now we can present the proof of the main results of this paper.

PROOF OF THEOREM 1.1. By Lemma 2.4, we have

$$\mu(G) - \frac{4m}{n} \leqslant \frac{2m}{n-1} + n - 2 - \frac{4m}{n} = (n-2)\left(1 - \frac{2m}{n(n-1)}\right)$$
$$\leqslant (n-2)\left(1 - \frac{2(n-1)}{n(n-1)}\right) = n - 4 + \frac{4}{n}.$$

The last inequality holds since G is connected and so has at least n-1 edges. The equality case is easy to see from Lemma 2.4.

PROOF OF THEOREM 1.2. By Lemma 2.4, we have

$$\mu(G) - \frac{2m}{n} \leqslant \frac{2m}{n-1} + n - 2 - \frac{2m}{n} = \frac{2m}{n(n-1)} + n - 2 \leqslant 1 + n - 2 = n - 1.$$

The last inequality holds since G has at most  $\frac{1}{2}n(n-1)$  edges. When this bound is attained,  $G = K_n$ .

PROOF OF THEOREM 1.3. Note that the sum of all the Laplacian eigenvalues is 2m, so we have  $(n-1)\lambda(G) \ge 2m$  and hence  $\lambda(G) \ge \frac{2m}{n-1}$ . By Lemma 2.4, we have

$$\mu(G) - \lambda(G) \leqslant \frac{2m}{n-1} + n - 2 - \frac{2m}{n-1} = n - 2.$$
se is easy to see from Lemma 2.4.

The equality case is easy to see from Lemma 2.4.

Acknowledgments. The authors are grateful to the referees for their comments.
